CYSE695-Bridge 2: Hands-On Lab Report 2

Name: Nathaly Flores

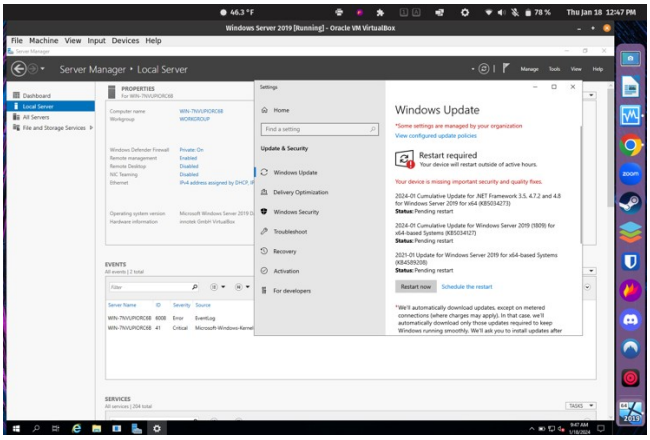

Directions: Review the tutorial video found in Module 2 and complete the following tasks. Submit your completed report in Canvas.

Basic Configuration Task in Windows Server 2019

Total Points = 50 points

Task 1.

1. Check for Windows updates.
2. Provide a screenshot of the completed task.

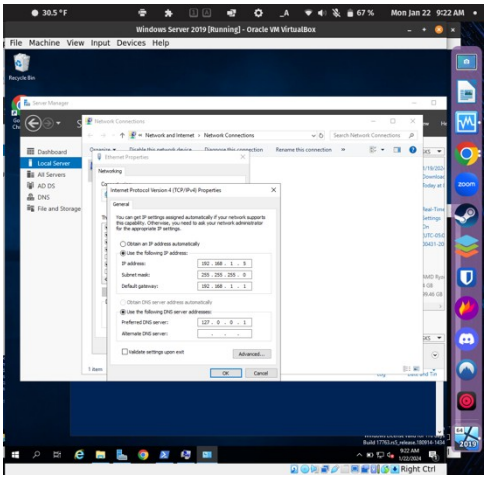

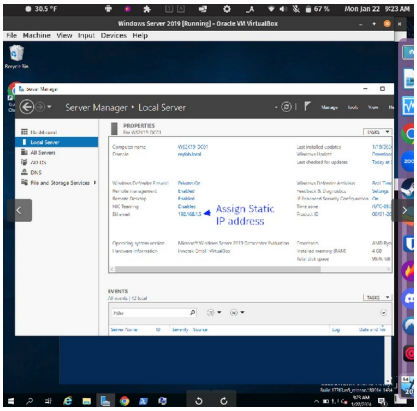

3. Briefly describe the screenshot, explaining the task or tool used.

In the screenshots above, I first had to open server manager and then click on local server and click on the ‘download updates only, using Windows update’ to get the latest update; as you can see by the first picture, I had quite a bit to update. Afterward, I restarted the computer, and Windows updates were now up to date.

Task 2.

1. Assign static IP address.
2. Provide a screenshot of the completed task.

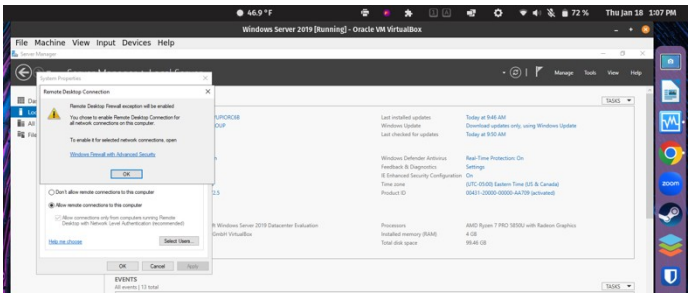

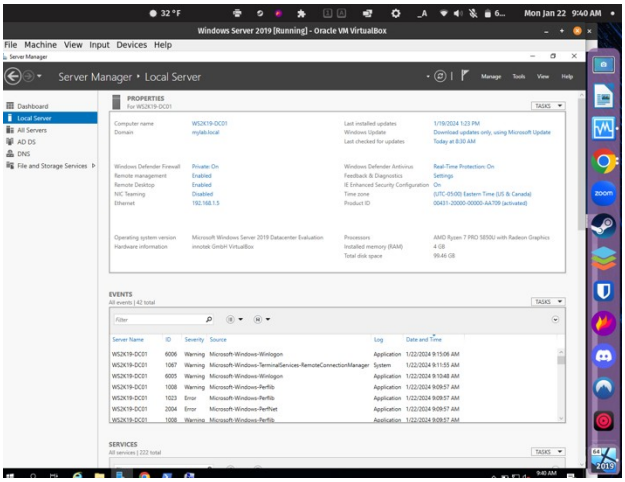

3. Briefly describe the screenshot, explaining the task or tool used.

In the server manager file, we clicked on Ethernet: IPv4 address assigned by DHCP, IPv6 enabled; once there, we opened properties in the Ethernet file and removed the check box of Internet Protocol Version 6 (TCP/IPv6), and we clicked on Internet Protocol Version 4 (TCP/IPv4) click on properties then we assigned the IP static of 192.168.1.5 Subnet mask: 255.255.255.0 and default gateway: 192.168.1.1.

Task 3.

1. Enable remote desktop management.
2. Provide a screenshot of the completed task.

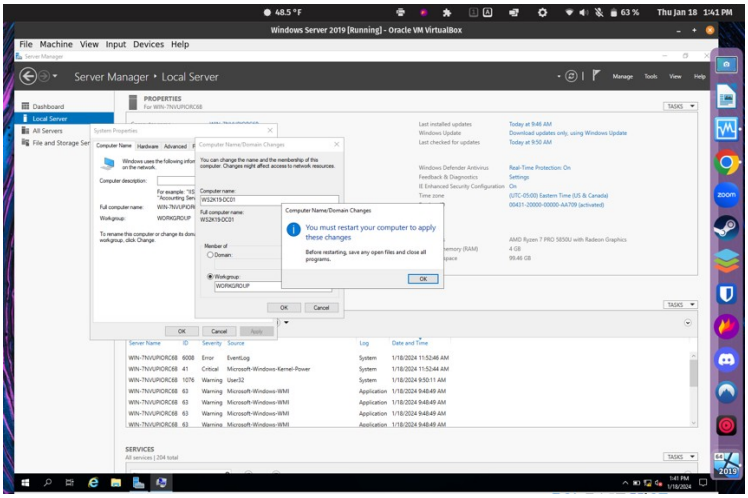

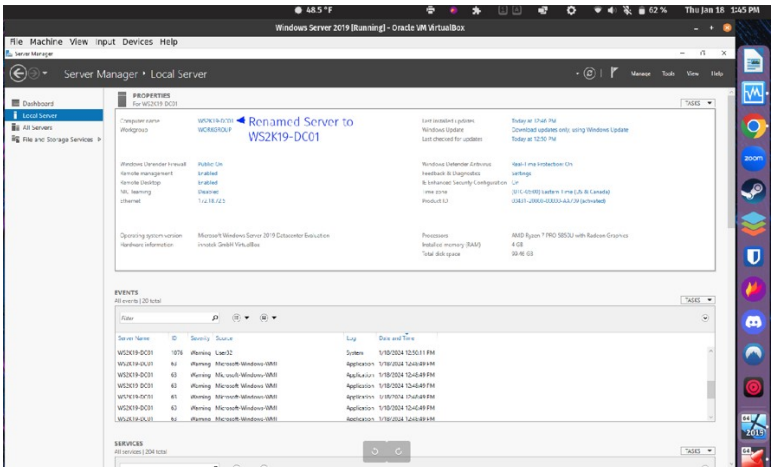

3. Briefly describe the screenshot, explaining the task or tool used.

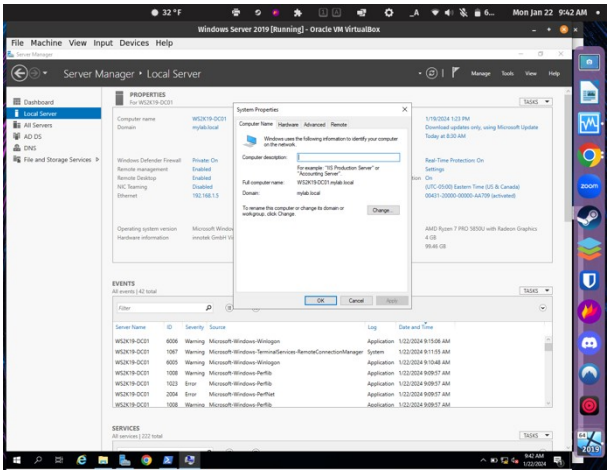

Remote management is always enabled, so the next step is to enable remote desktop; once it was opened, I did ‘allow remote connections to this computer’ and then applied the settings, then okay. I proceeded to close everything out, and on the second screenshot, you can see that the remote desktop is enabled now.

Task 4.

1. Rename your server.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

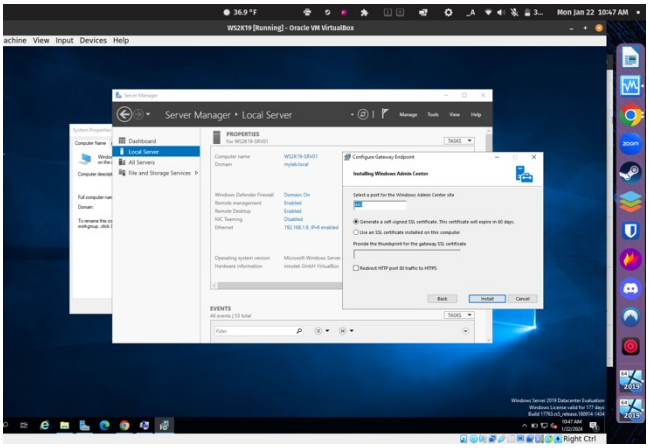

In the above screenshots, I clicked on the computer name and then 'changed' the computer name to WS2K19-DC01, meaning Windows Server 2019-Domain Controller 01. Then I clicked on 'apply' and then ok; afterward, I had to restart the computer so the name change could take effect. After the restart, you can see in the second screenshot that the computer name is now showing as 'WS2K19-DC01', and in the third screenshot, it now shows that it has its domain controller name, which is my lab.local, there was a huge gap doing this homework; nothing in the videos talks about adding a domain controller and installing it, so I had to search around and add this feature, including a firewall rule, to get this working with my internet. After adding 'mylab.local', I had to restart the computer so all the changes I did would take effect; I use this https://www.virtualgyanis.com/post/step-by-step-how-to-install-and-configure-domain-controller-on-windows-server-2019 as my step to add directory domain controller for the first time.

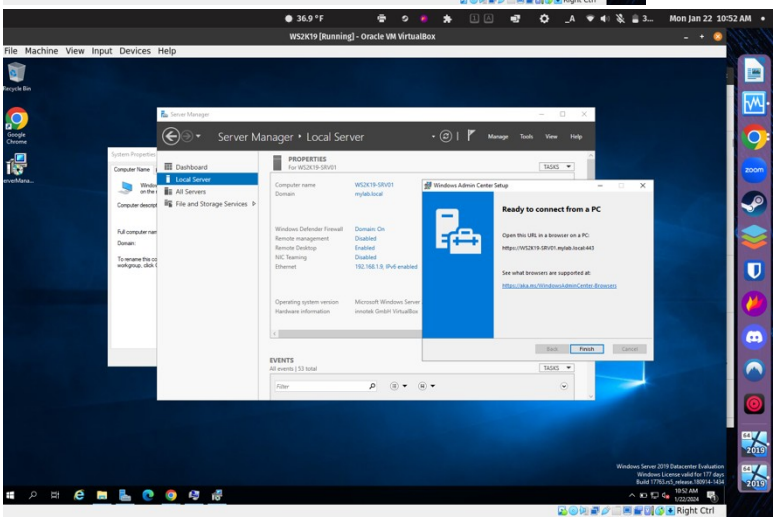

Installing Windows Admin Center on Windows Server 2019

Total Points = 50 points

Task 5.

1. Select a port for the Windows Admin Center.
2. Provide a screenshot of the completed task.

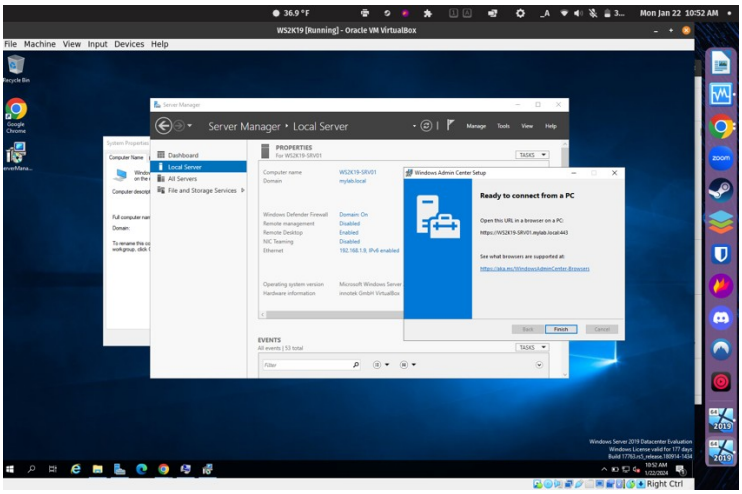

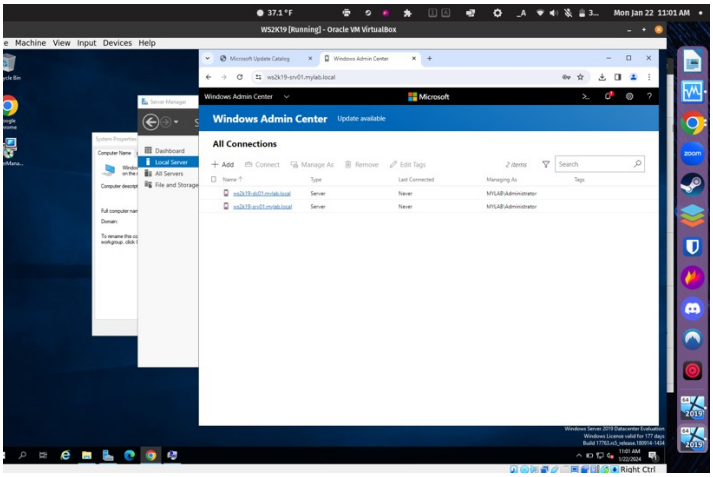

3. Briefly describe the screenshot, explaining the task or tool used.

In the screenshot above, by default, port number 443 is the port for my Windows server, and the other screenshot shows when the installation was completed for version 1809.5.

Task 6.

1. Start the installation process.
2. Provide a screenshot of the completed task.

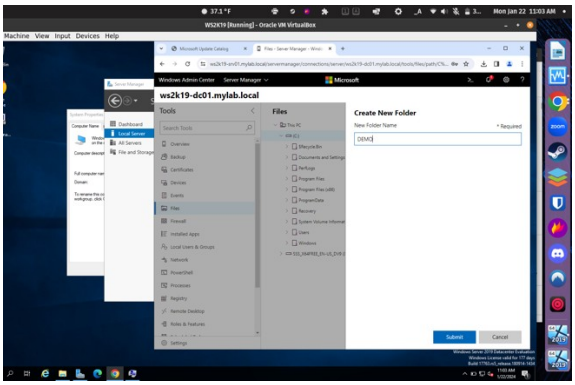

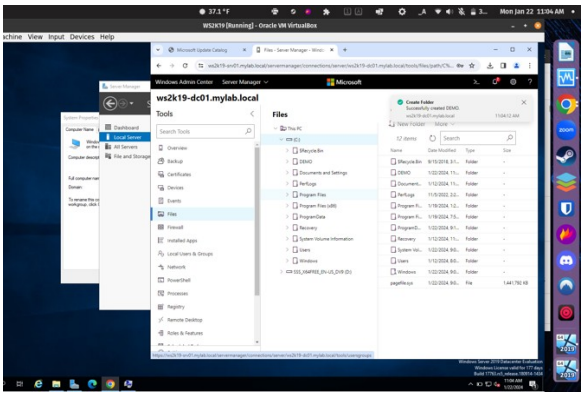

3. Briefly describe the screenshot, explaining the task or tool used.

In the above screenshots, I started the installation for the Windows admin center 1809.5 version and then used https://ws2k19-srv01.mylab.local:443 to log into this admin center and add the ws2k19-dc01.mylab.local to my Windows admin center have them all together in one place so I can be able to login into to any of my domain controller server.

Task 7

1. Create a new folder.
2. Provide a screenshot of the completed task.

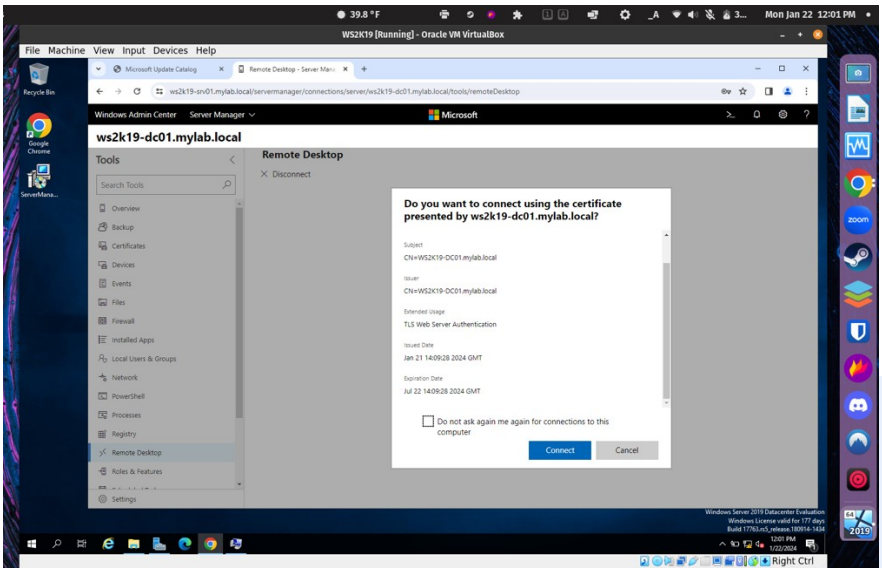

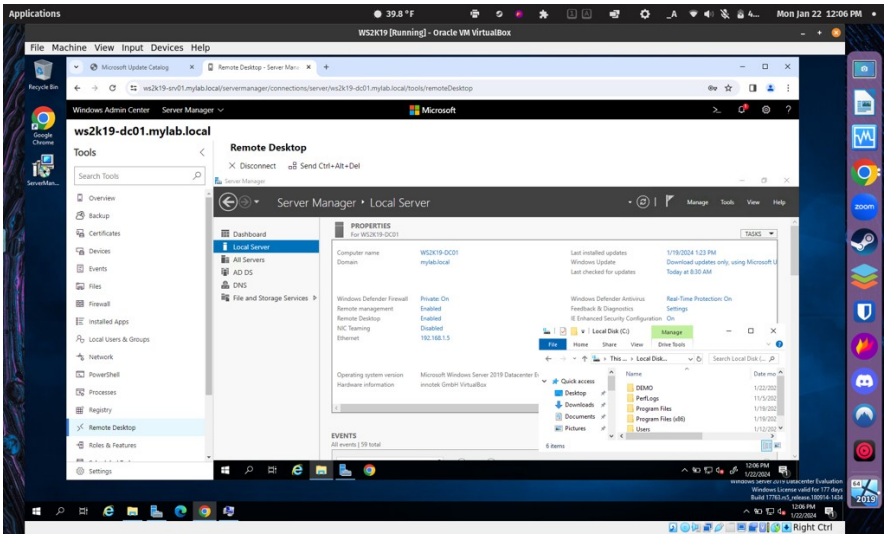

3. Briefly describe the screenshot, explaining the task or tool used.

In the screenshot above, I created a folder named ‘DEMO’ and logged into ws2k19-dc01.mylab.local created this file, and it went through successfully. The last screenshot shows the file and its message in the top right corner.

Task 8.

1. Connect remote desktop.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

In the screenshots above, I clicked on the remote desktop in the ws2k19-dc01.mylab.local and then added my credentials, which was MYLAB\administrator and my password, and viola, I was able to connect and login into my domain controller server account and as you can see you can also see the 'DEMO' folder I created previously.
