CYSE695-Bridge 2: Hands-On Lab Report 3

Name: Nathaly Flores

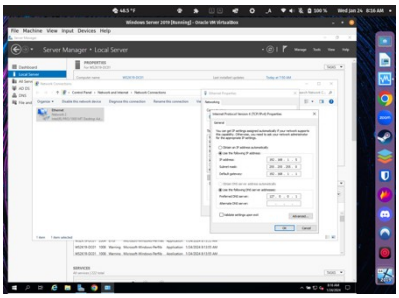

Directions: Review the tutorial video found in Module 3 and complete the following tasks. Submit your completed report in Canvas.

Install and Setup DNS service in Windows Server 2019

Total Points = 50 points

Task 1.

1. Update Ethernet properties.
2. Provide a screenshot of the completed task.

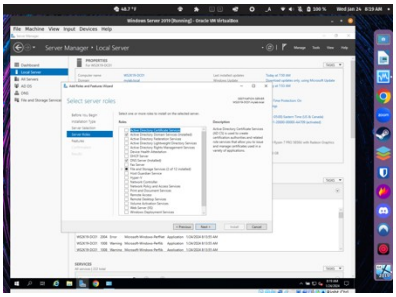

3. Briefly describe the screenshot, explaining the task or tool used.

In the screenshot above, here are my ethernet properties with the IP address 192.168.1.5 and subnet mask 255.255.255.0, using the DNS server 127.0.0.1.

Task 2.

1. Start the installation process.
2. Provide a screenshot of the completed task.

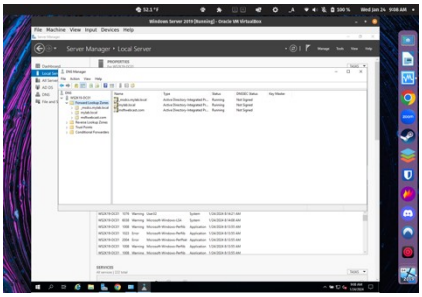

3. Briefly describe the screenshot, explaining the task or tool used.

Previously, I had to install a DNS server for lab 2, which was already installed on my Windows server. I had to manage, click on add roles and features, and install the DNS server.

Task 3.

1. Add a new zone.
2. Provide a screenshot of the completed task.

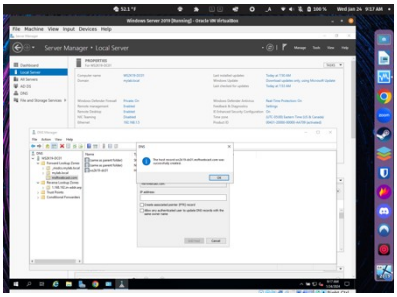

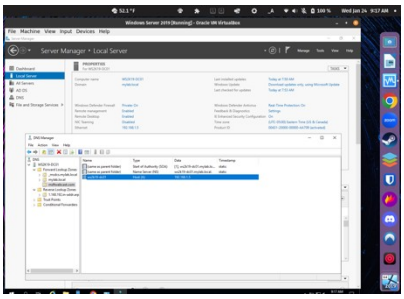

3. Briefly describe the screenshot, explaining the task or tool used.

As I mentioned, I already had existing zones, so I followed the videos and created a new one using msftwebcast.com, as he had it in the video. By clicking forward, look up left click to create ‘new zone’, and from there, I had a new zone with the name I mentioned.

Task 4.

1. Add a new host.
2. Provide a screenshot of the completed task.

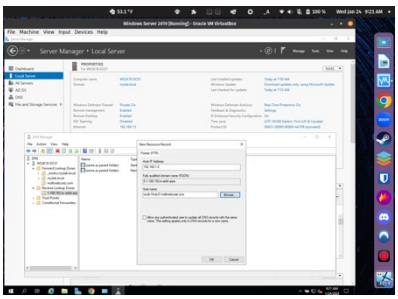

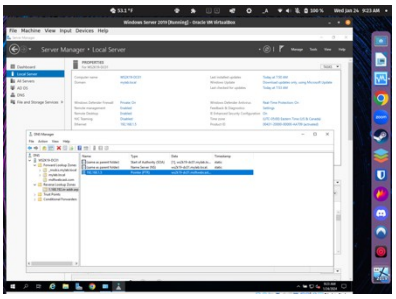

3. Briefly describe the screenshot, explaining the task or tool used.

In the screenshot above, I followed the steps in the video in creating a ‘new host,’ so what I did was right-click on the msftwebcast.com and clicked on ‘new host (A or AAAA) …’ then I followed the steps in how to create the new host, and I named It ‘ws2k19-dc01’ host.

Task 5.

1. Add a new resource record.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

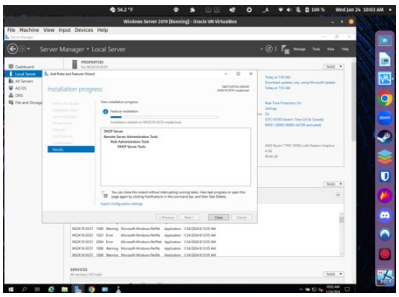

In the reverse lookup, the zone is where you create the 'new resource record' form; there, I right-clicked 'the new pointer' and looked for the name I created previously in the forward lookup, which was msftwebcast.com and merged everything together as you can see in the pictured as I browsed for the file and then added it together the new resource record was done.

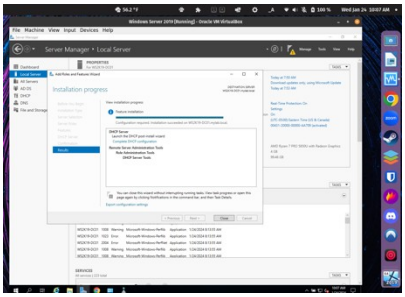

Install and Configure DHCP Server in Server in Windows Server 2019

Total Point = 50 points

Task 6.

1. Install DHCP Server role.
2. Provide a screenshot of the completed task.

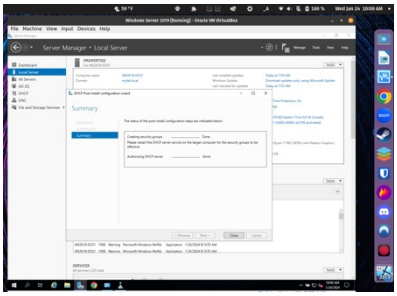

3. Briefly describe the screenshot, explaining the task or tool used.

In the sceenshot I completed the steps for installation for DHCP server role by clicking on manage add roles and feature I was able to get this process installe and now after the installation is finish I have to create a post install configuration for DHCP.

Task 7.

1. Complete DHCP post install configuration task.
2. Provide a screenshot of the completed task.

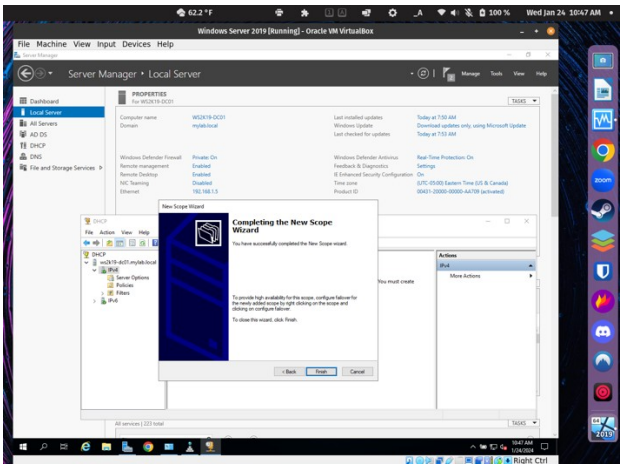

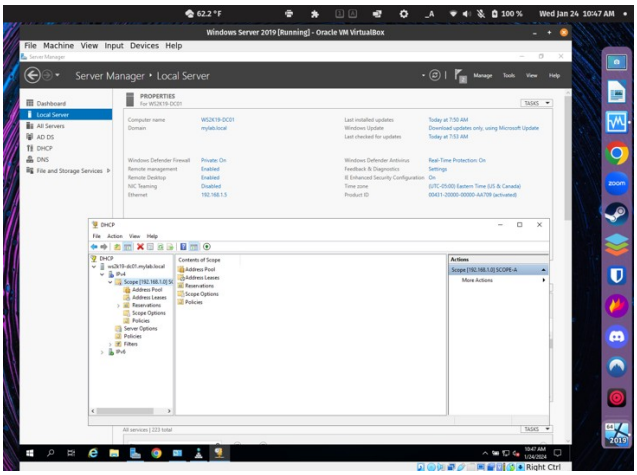

3. Briefly describe the screenshot, explaining the task or tool used.

I created the post DHCP post install after I did the DHCP server role I had a yellow signed in the upper right corner telling me I have to complete this process to get the official DHCP post installed that is what I did.

Task 8.

1. Create at least one DHCP scope.
2. Provide a screenshot of the completed task.

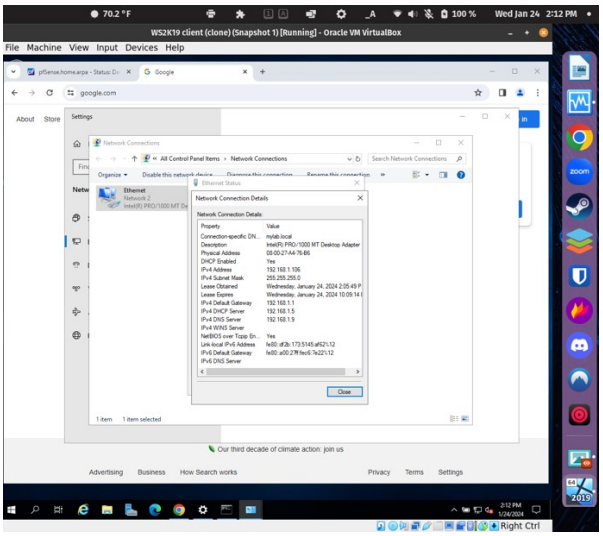

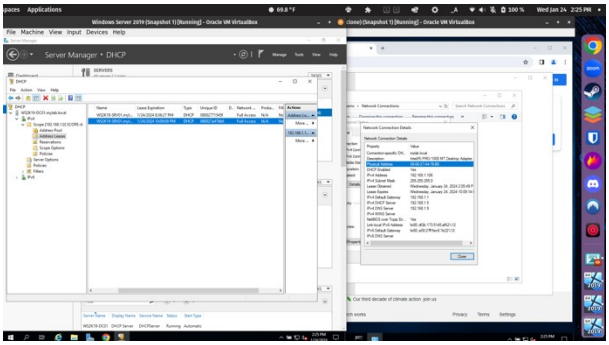

3. Briefly describe the screenshot, explaining the task or tool used.

I created a scope in the domain controller and created the name SCOPE-A with my IP address in the screenshot and my gateway (router) of 192.168.1.1. After activating my scope, the DHCP can now assign IP addresses automatically to the client computer. For instance, this will be the client computer I made for task 9.

Task 9.

1. Show Ethernet status and network connection details.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

After I clicked on ethernet in the properties section, I put ‘obtain an IP address automatically’, clicked ok, and then closed it out, and then right-clicked and did status; then I clicked details, it showed DHCP ‘yes’ as connected with my domain controller server virtual box and the IP address that was assigned to it which is 192.168.1.106.another vital fact to note it is showing the Lease Obtained and when it expires Now, my internet is connected using my domain controller internet account. In the following screenshot, you can see in my domain controller virtual box that the client max address matches the next virtual box, my client account. Everything is done correctly.
