CYSE695-Bridge 2: Hands-On Lab Report 4

Name: Nathaly Flores

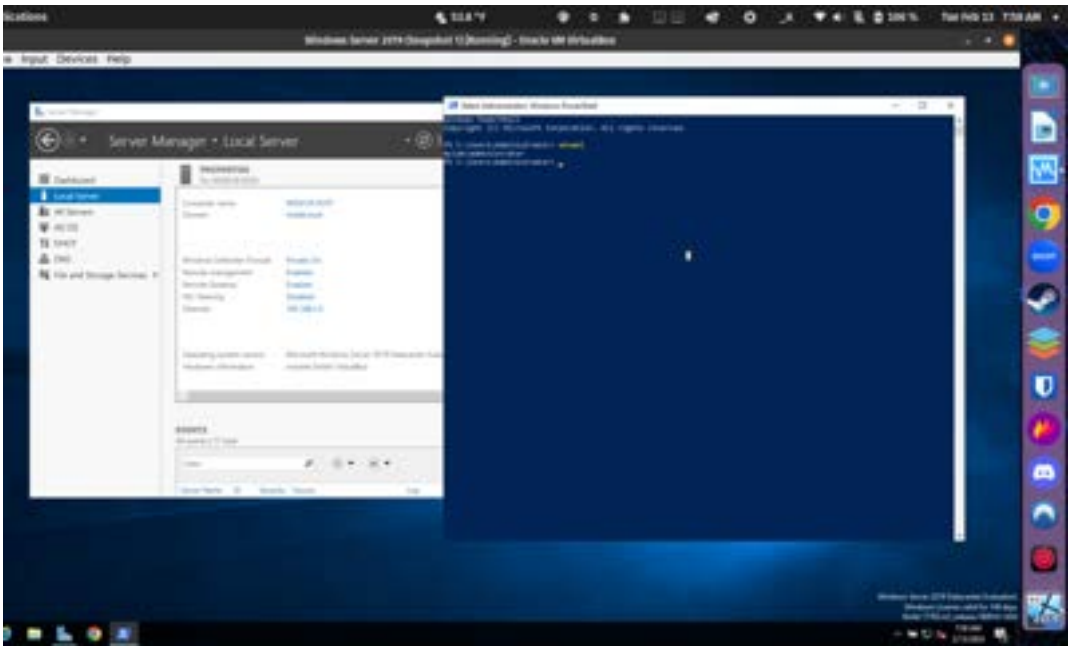

Directions: Review the tutorial video found in Module 4 and complete the following tasks. Submit your completed report in Canvas.

Setting up Active Directory in Windows Server 2019

Total Points = 50 points

Task 1.

1. Login to the server as an administrator.
2. Provide a screenshot of the completed task.

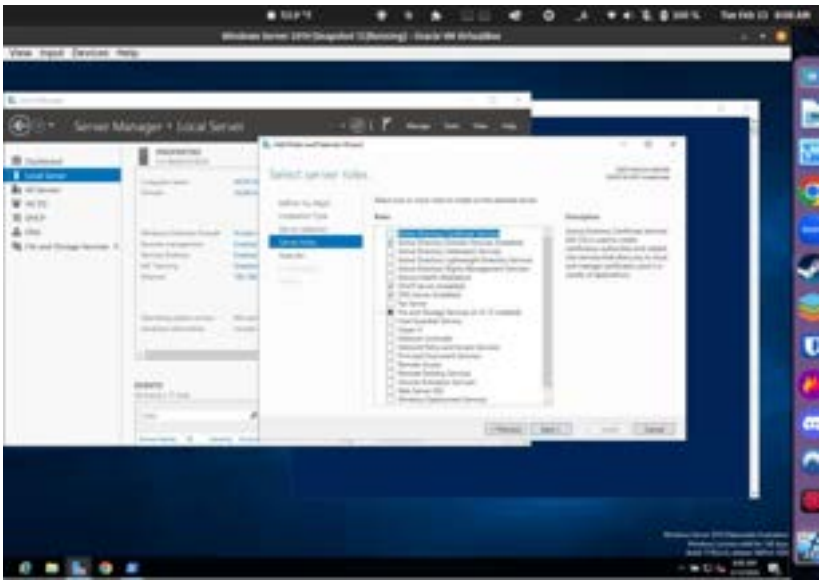

3. Briefly describe the screenshot, explaining the task or tool used.

In the above, in my domain controller server, I have verified that I am in the controller and have privileges as Administrator by opening PowerShell and inputting 'whoami.' As you can see in both pictures, I am in my domain controller server, Windows 2019.

Task 2.

1. Add domain controller to an existing domain.
2. Provide a screenshot of the completed task.

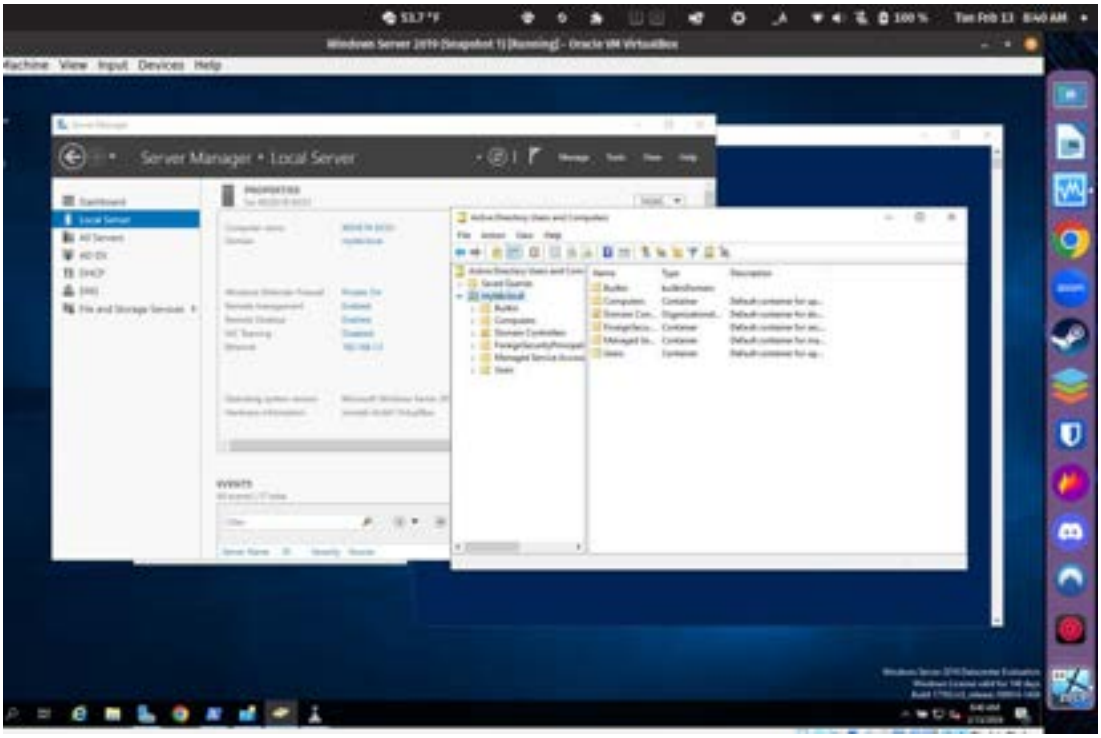

3. Briefly describe the screenshot, explaining the task or tool used.

I already did this step when I did lab 3. I added my active directory controller services and the DNS services; as you can see, those are installed, and I also added the change name ‘mylab.local’ name changed to the server.

Task 3.

1. Specify the location of active directory data log files.
2. Provide a screenshot of the completed task.

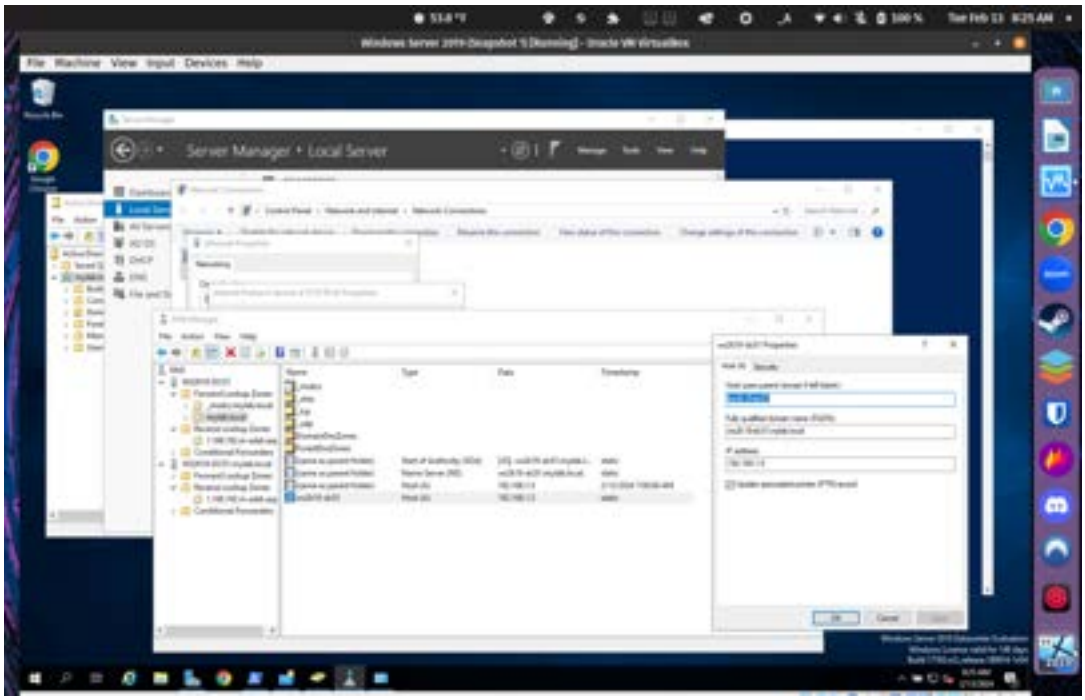

3. Briefly describe the screenshot, explaining the task or tool used.

In the above picture, you can see my active directory users and computer folder; after I installed the necessary roles, those are my results.

Task 4.

1. Start installation.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

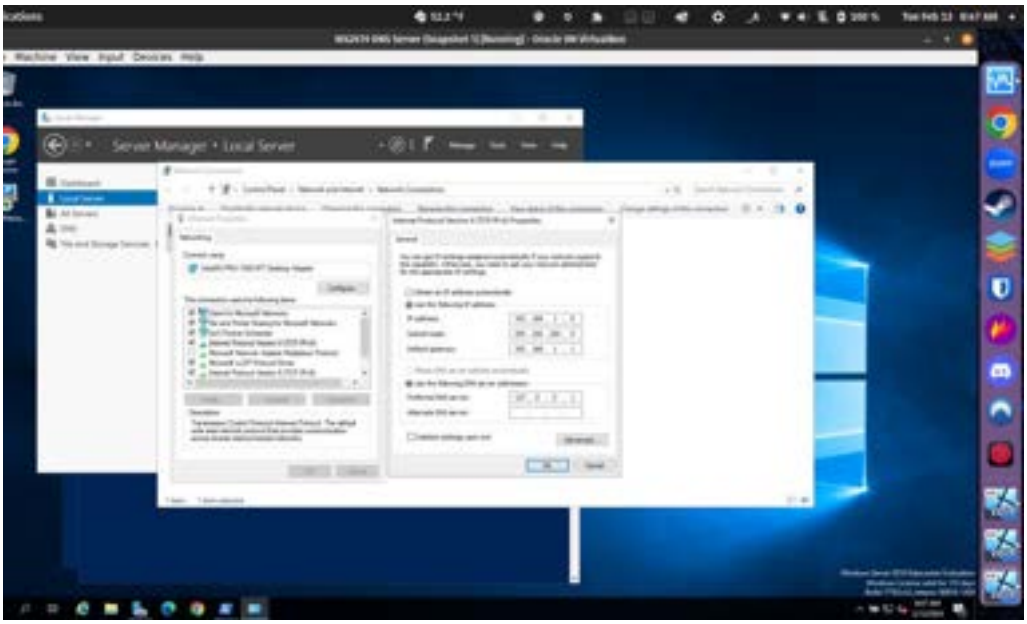

I have already specified where my DNS and Active directory folder are in the above picture. I added a reverse lookup zone in my DNS server and checked the box after the installation.

How to Join Windows Server 2019 to an Existing Active Directory Domain

Total Point = 50 points

Task 5.

1. View Ethernet properties.
2. Provide a screenshot of the completed task.

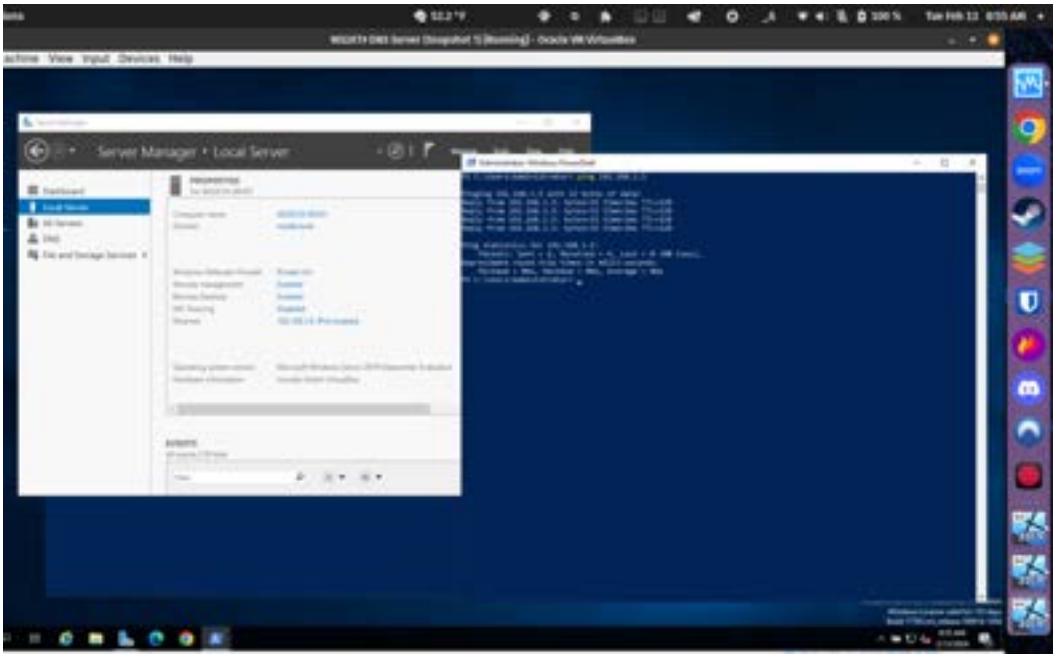

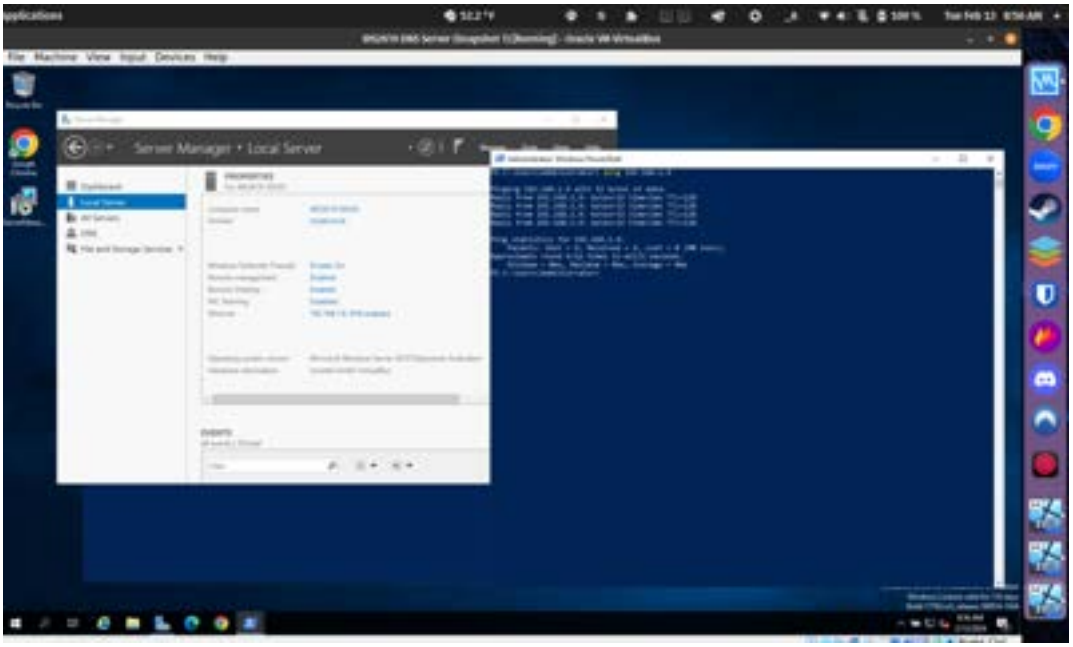

3. Briefly describe the screenshot, explaining the task or tool used.

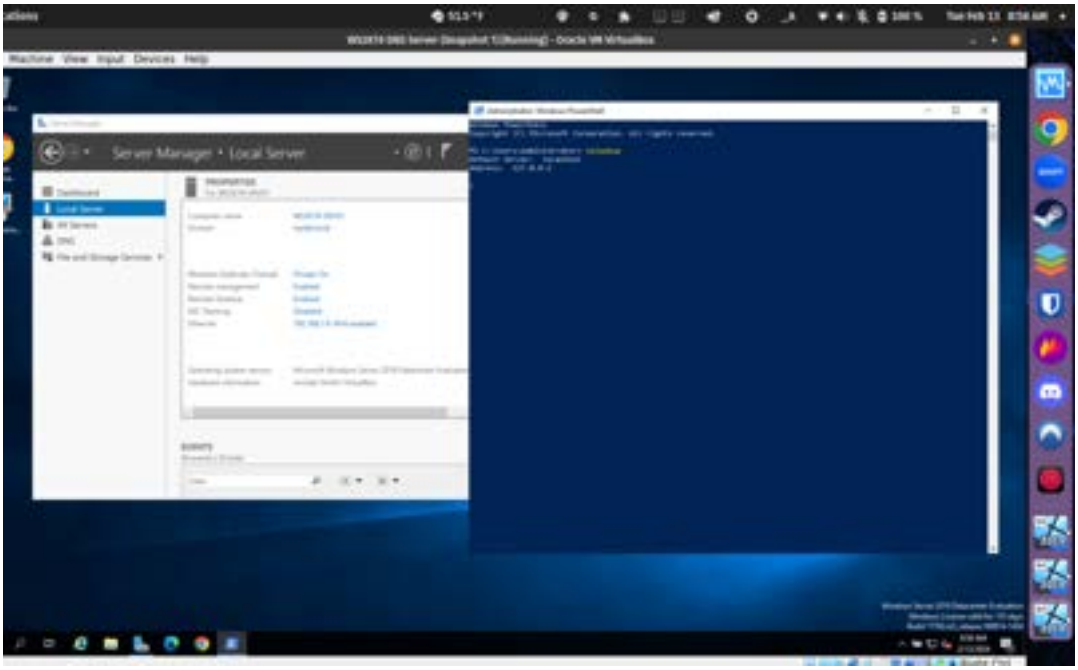

Here is the above picture of my ethernet properties. As you can see, my default gateway is 192.168.1.1, the subnet mask is 255.255.255.0, and my preferred DNS server is 127.0.0.1. I have Pfsense, which gives internet and connects both my server and domain controller together.

Task 6.

1. Use nslookup in PowerShell.
2. Provide a screenshot of the completed task.

Server Manager • Local Server

Server Manager • Local Server

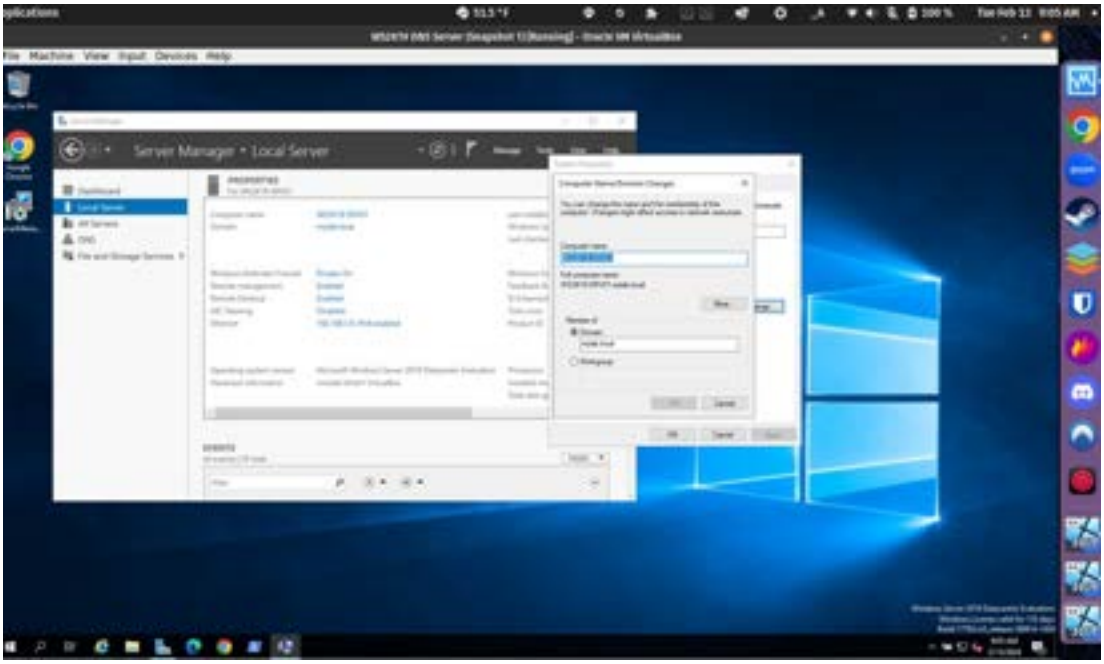

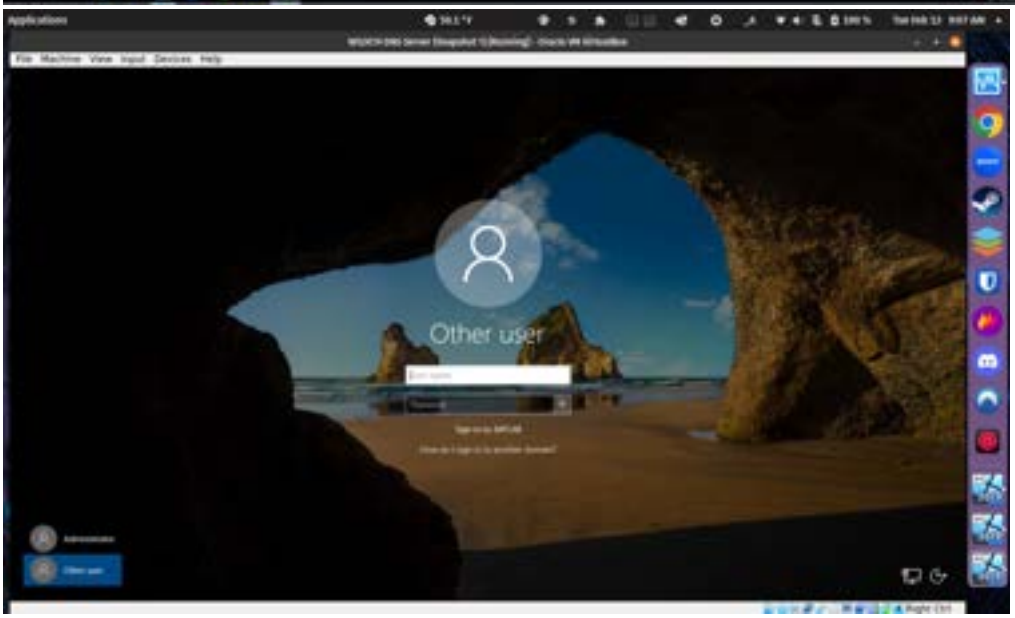

3. Briefly describe the screenshot, explaining the task or tool used.

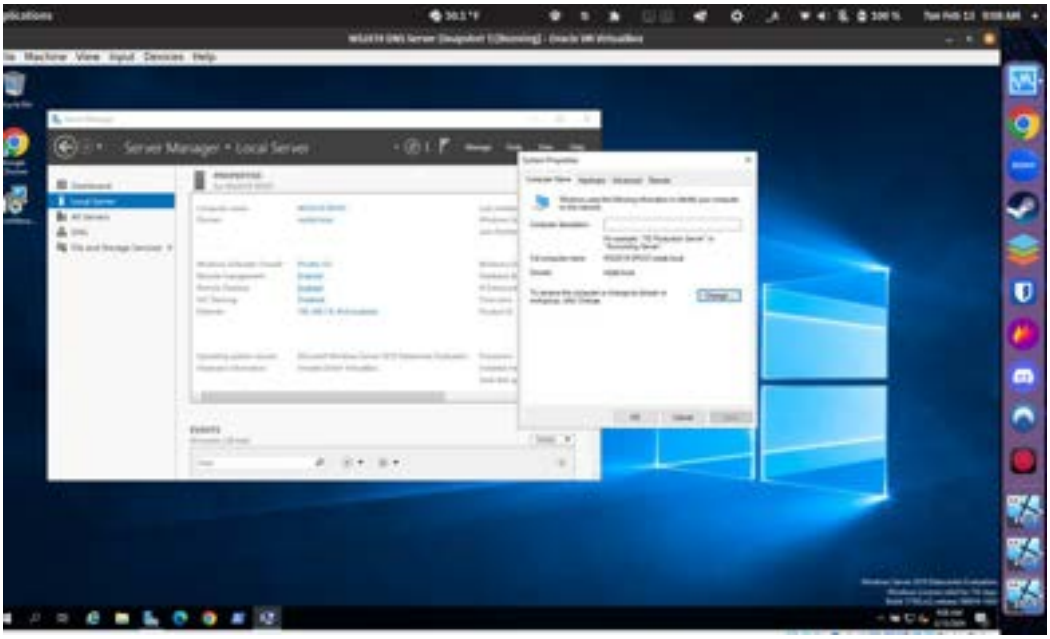

In the above pictures, I ping first 192.168.1.5, my domain controller, and I also ping 192.168.1.9, my server. I did the lookup, and it gave me the default server: localhost and address of 127.0.0.1; I have not removed the 127.0.0.1 because I will lose the internet on both VMs, and they will not ping each other afterward.

Task 7.

1. Retrieve system properties computer name/description.
2. Provide a screenshot of the completed task.

Server Manager • Local Server

Other user

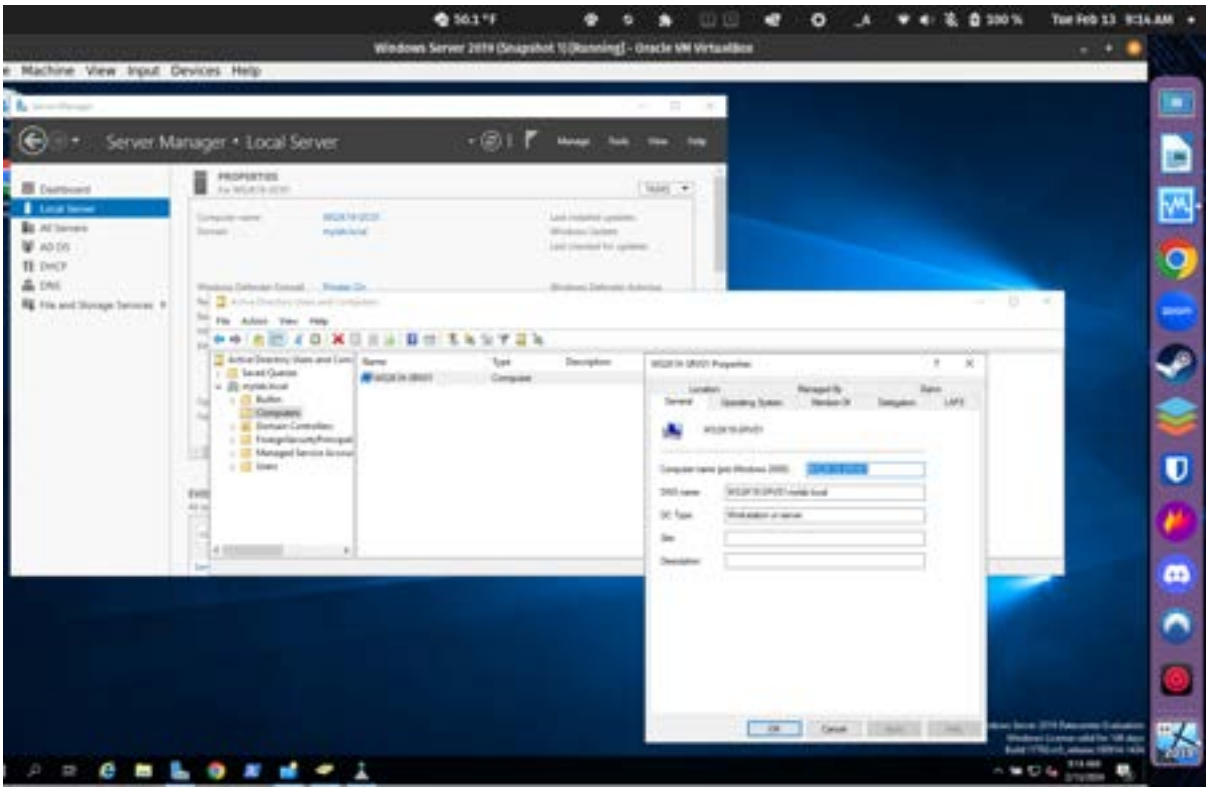

3. Briefly describe the screenshot, explaining the task or tool used.

In the above picture, I have changed the name to mylab.local restarted the computer and logged into the correct my lab account. In the third picture, you can see that those changes took effect, and everything is now in the same mylab.local domain name means I have the domain controller and server in one domain name.

Task 8.

1. Retrieve Active Directory users and computers.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

In my domain controller, I went to tools and clicked on Active Directory Users and Computers in the section of my lab.local, I clicked on computers, and you can see that my server machine is showing as WS2K19-SRV01, and the details of my computer VM, for instance, I am running Windows Server 2019 datacenter evaluation and general information, are shown in the picture above.
