CYSE695-Bridge 2: Hands-On Lab Report 7

Name: Nathaly Flores

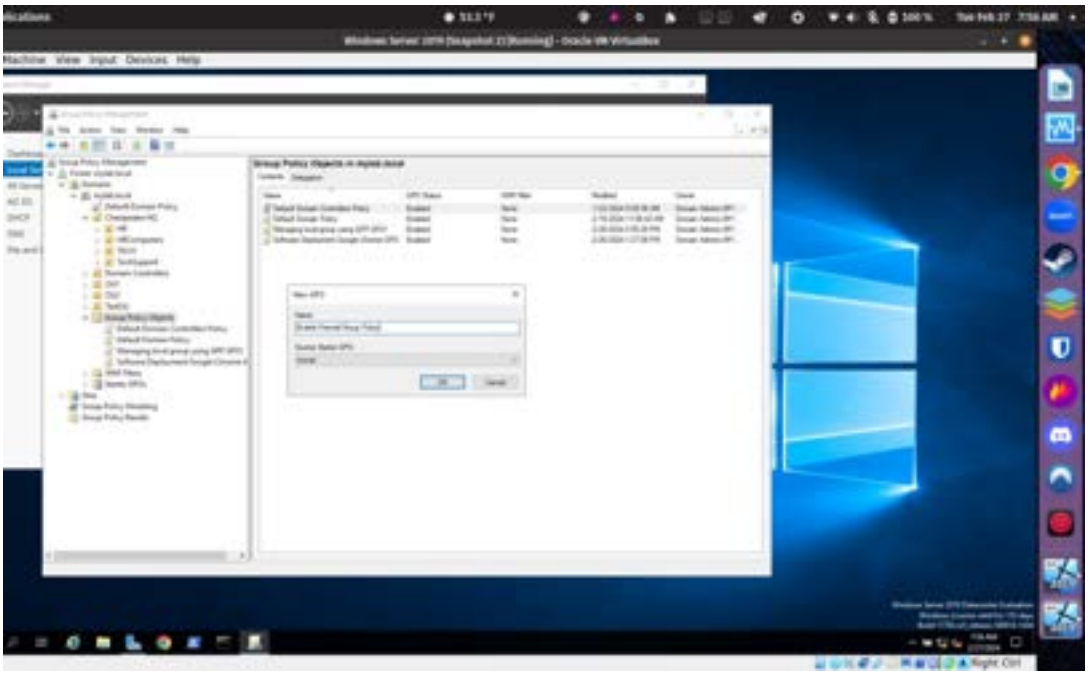

Directions: Review the tutorial video found in Module 7 and complete the following tasks. Submit your completed report in Canvas.

Enable or Disable Firewall Using Group Policy in Windows Server 2019

Total Points = 50 points

Task 1.

1. Create a new Group Policy Object.
2. Provide a screenshot of the completed task.

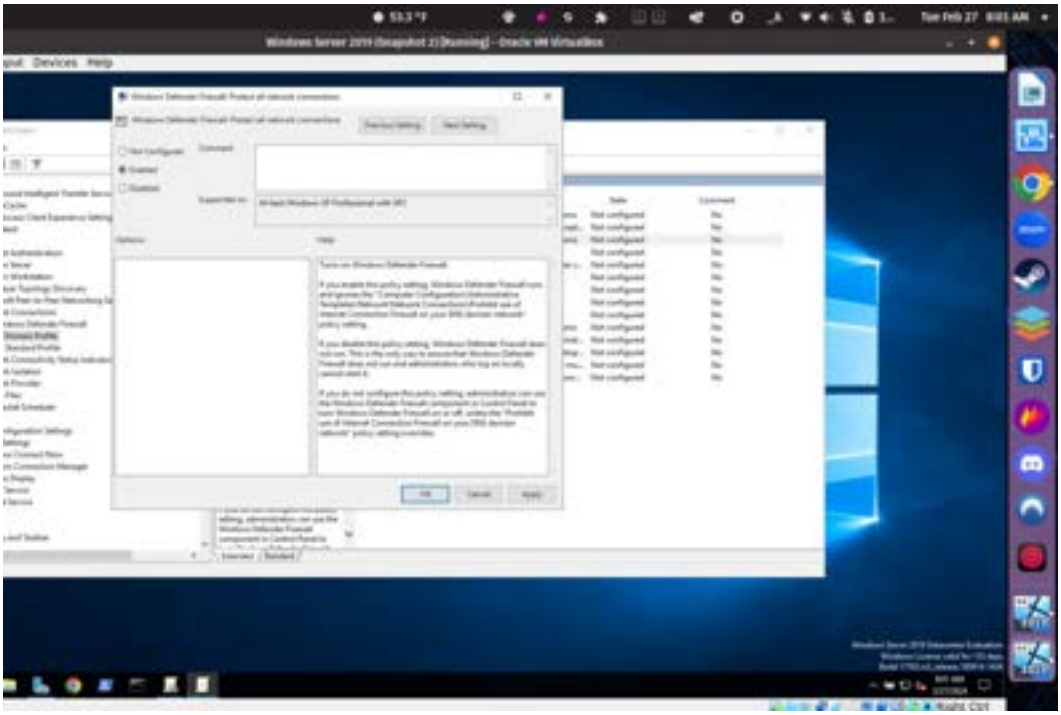

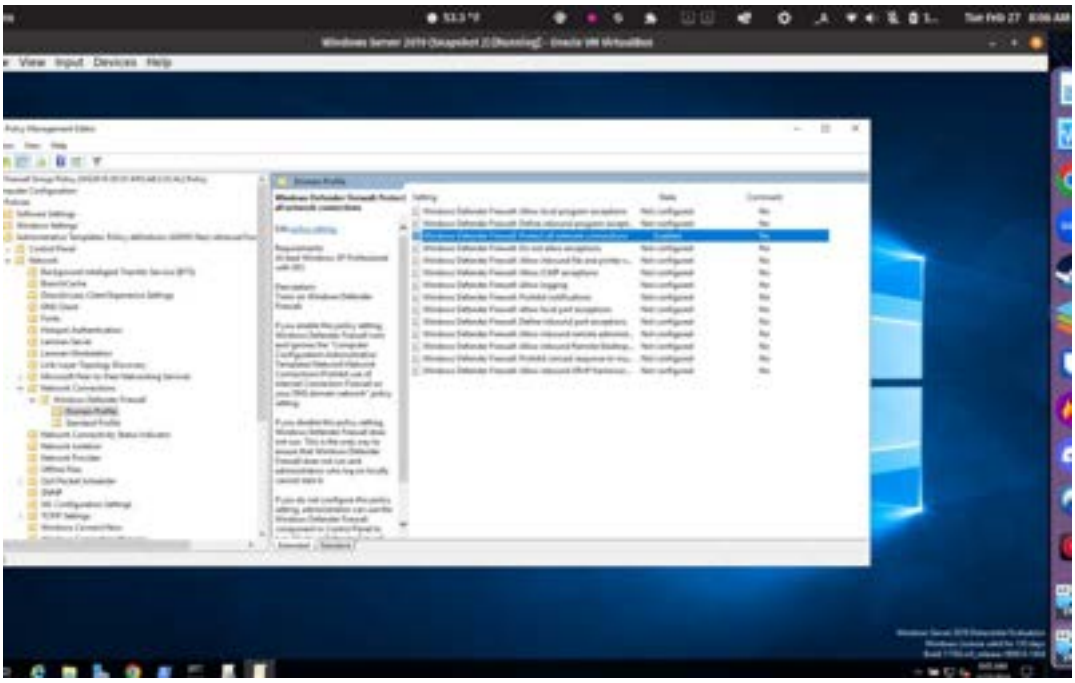

3. Briefly describe the screenshot, explaining the task or tool used.

In the above screenshot, I created a policy under group policy management named 'Enable Firewall Group Policy' in my active directory, Windows 2019.

Task 2.

1. Enable Windows Defender Firewall.
2. Provide a screenshot of the completed task.

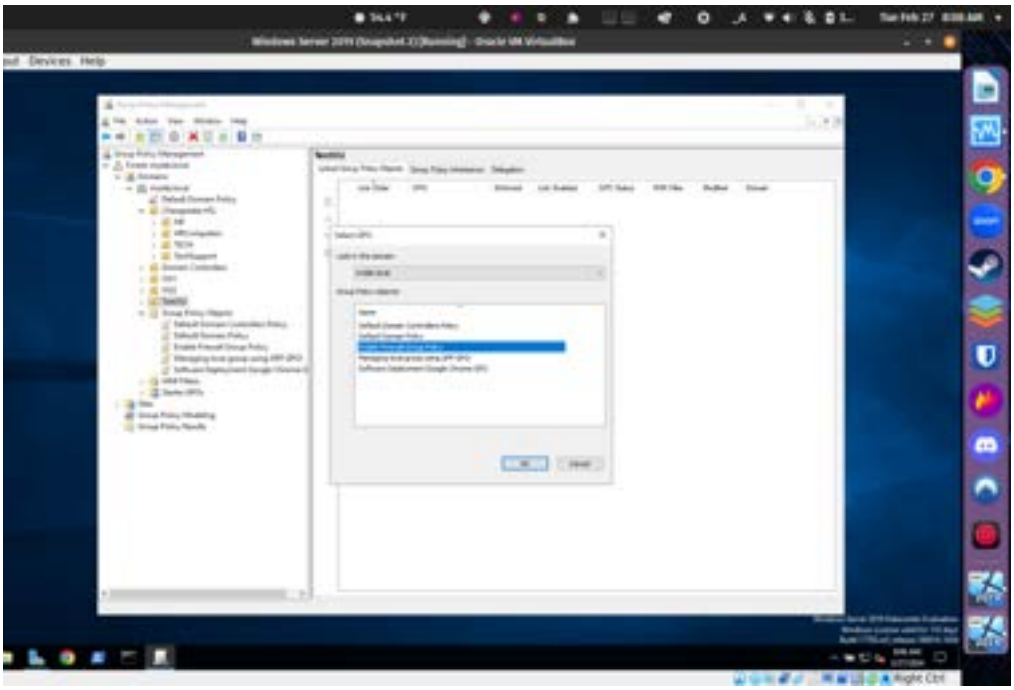

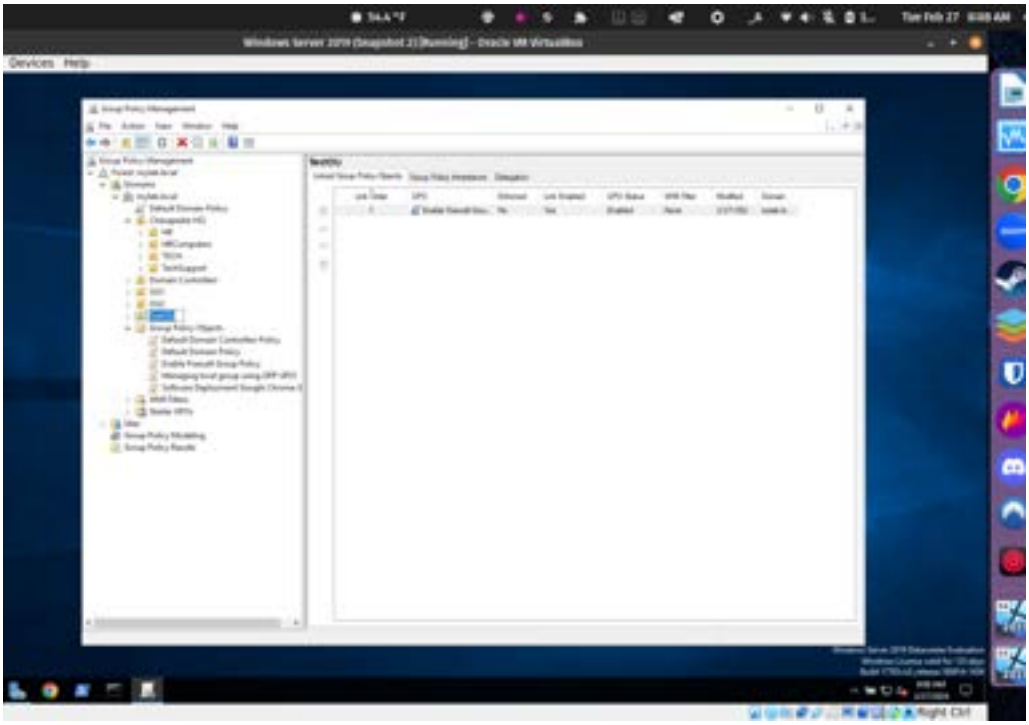

3. Briefly describe the screenshot, explaining the task or tool used.

In my active directory, I clicked on Group Policy Management, clicked on Edited, and it opened Group Policy Management Editor; from there, I searched In Policies for Administrative Templates: Policy definitions (ADMX Files) retrieved from then Network Connections from their Domain Profile, then 'Windows Defender Firewall: Protect all network connects' then I applied the 'enabled' then hit ok after applied, and it now shows enable for firewall.

Task 3.

1. Create a link for an existing Group Policy Object.
2. Provide a screenshot of the completed task.

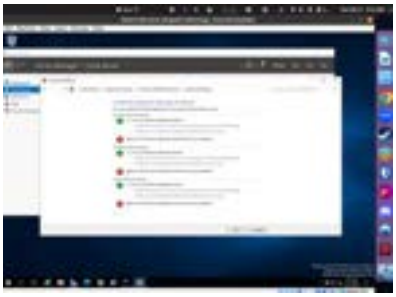

3. Briefly describe the screenshot, explaining the task or tool used.

In Group Policy Management, I looked for the OU I created, which is 'TestOU,' then I right clicked and Linked an Existing GPO, which is my 'Enable Firewall Group Policy.' It is now showing in the OU TestOU in the second picture. Don't mind my 'TextOU' named for the file I renamed it to 'TestOU'.

Task 4.

1. Disable Windows Defender Firewall.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

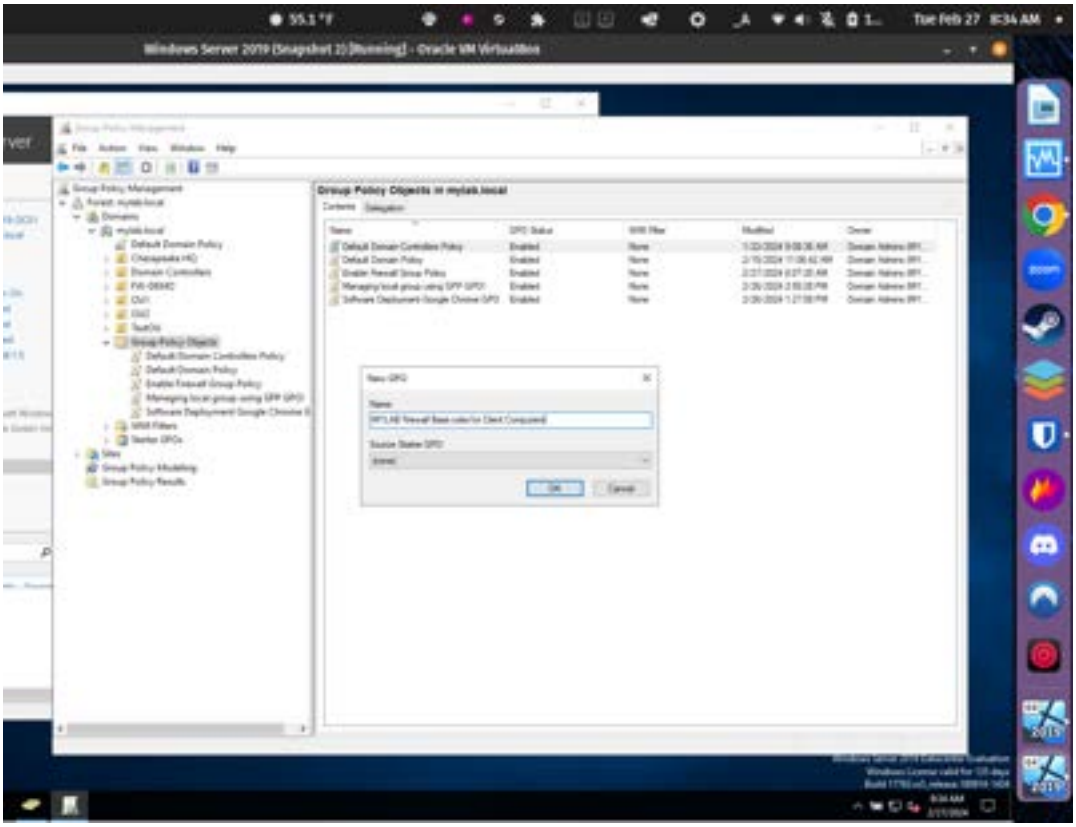

In my Windows server machine, run the command to find the firewall.cpl, then it directed me to the Windows Defender Firewall control panel. From there, I disabled the firewall by going to 'Turn Windows Defender Firewall on or off.' Turn off Windows Defender Firewall in the domain network settings, then proceed to turn off Windows Defender firewall in the Private network settings, then public network settings also turned off Windows Defender firewall then I hit ok; as you can see in the second screenshot, everything is turned off now.

Configure Windows Firewall Using Group Policy in Active Directory

Total Point = 50 points

Task 5.

1. Create a new Group Policy Objects.
2. Provide a screenshot of the completed task.

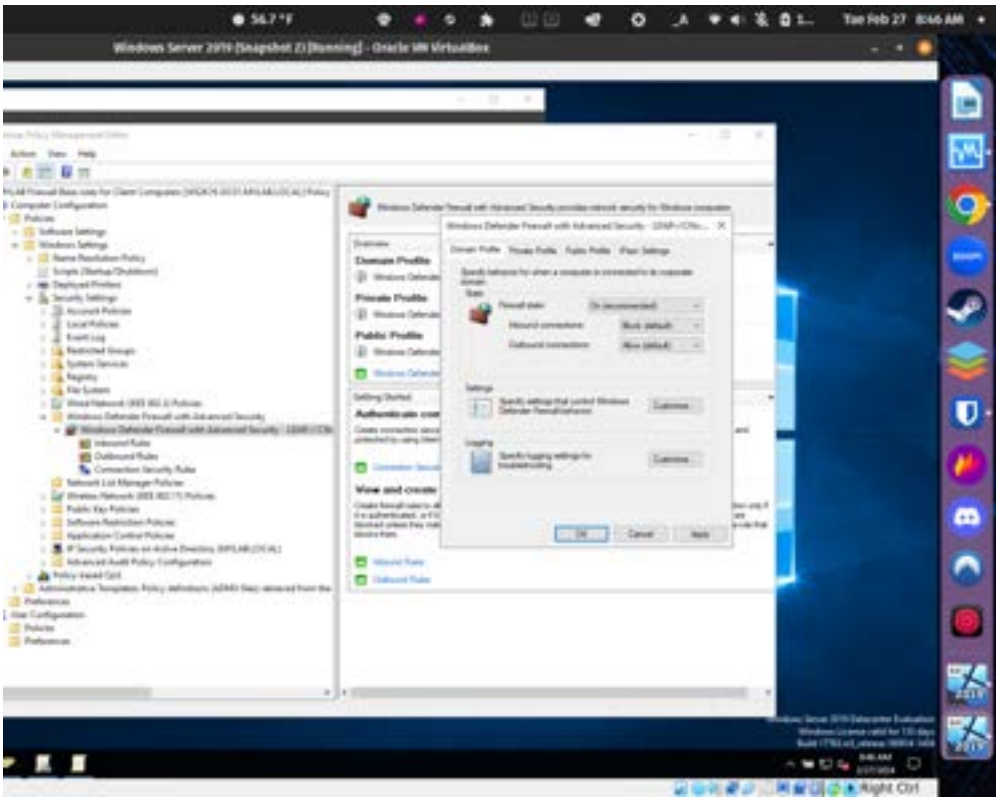

3. Briefly describe the screenshot, explaining the task or tool used.

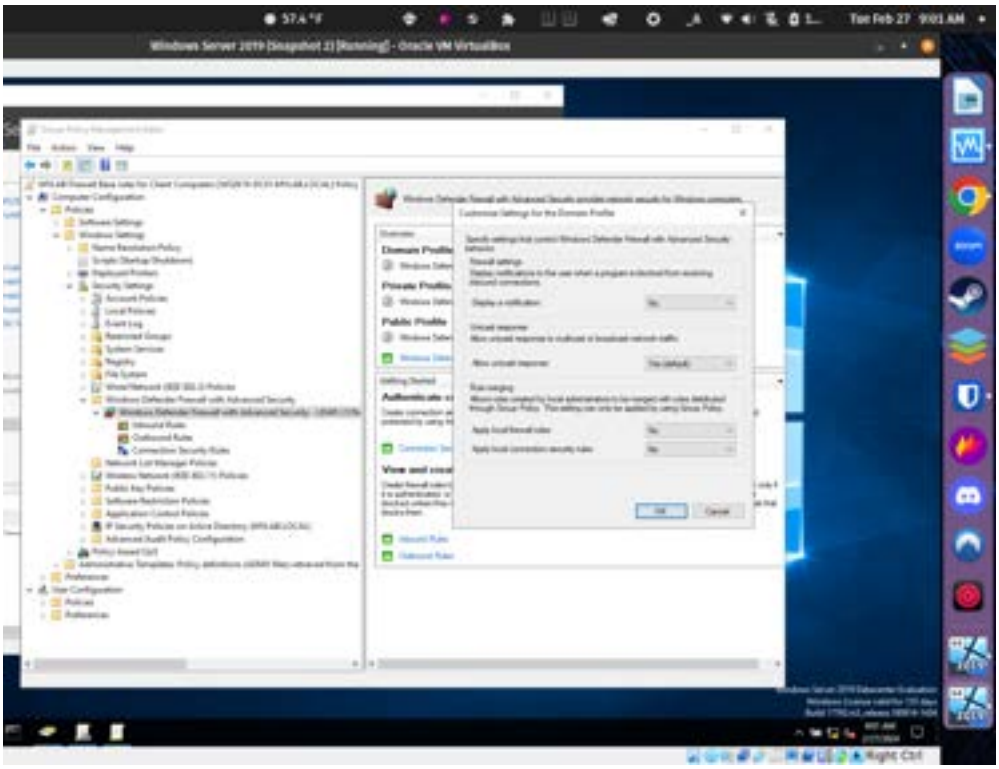

Once again, I opened up Group Policy Management in my Server Manager and created a ‘new policy’ named MYLAB Firewall Base for Client Computers, then hit okay to create.

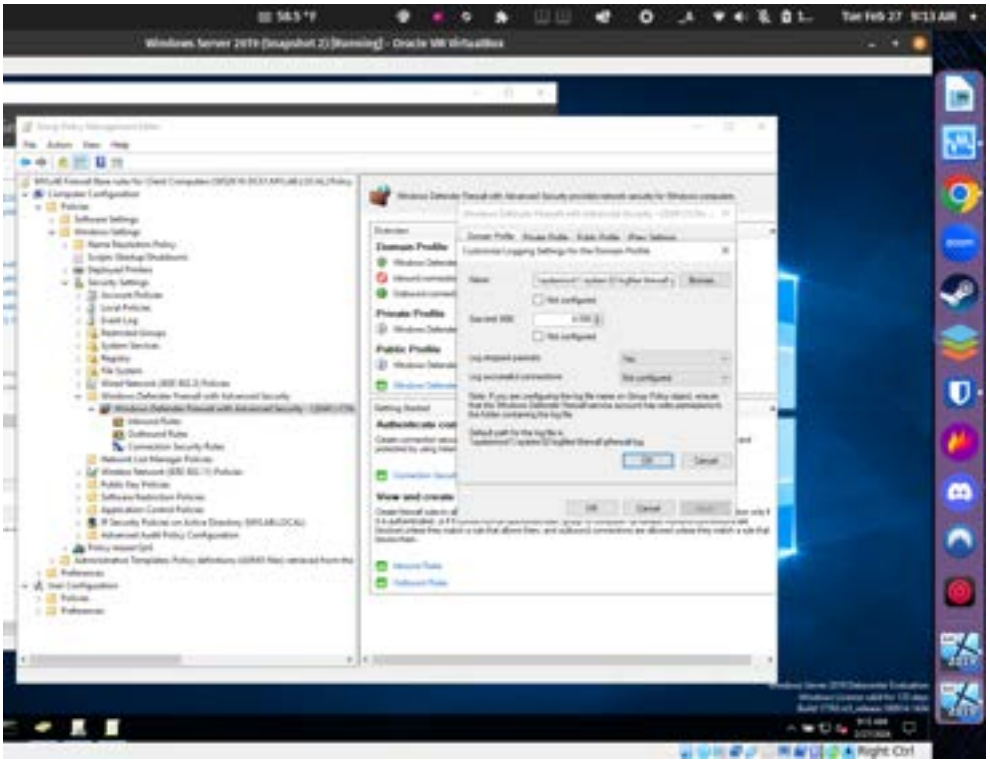

Task 6.

1. Configure Windows Defender Firewall state for domain, private, and public profiles.
2. Provide a screenshot of the completed task.

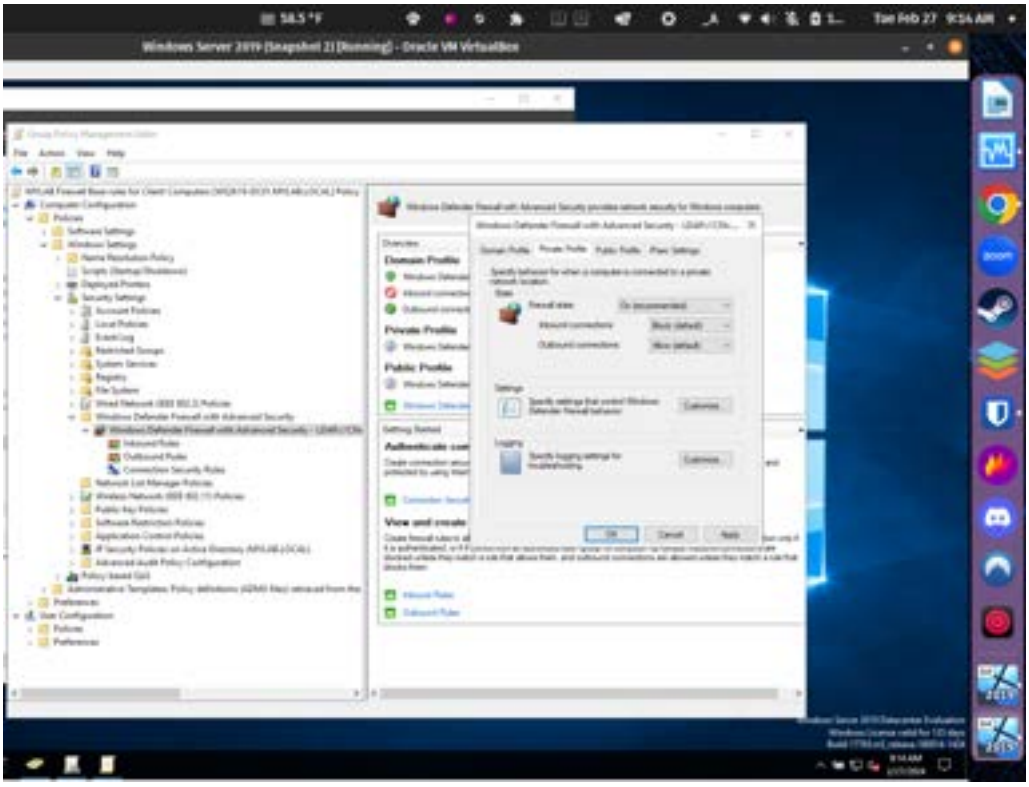

Domain Profile

56.7 °F
Tue Feb 27 8:46 AM
Windows Server 2019 [Snapshot 2] [Running] - Oracle VM VirtualBox
Right Ctrl

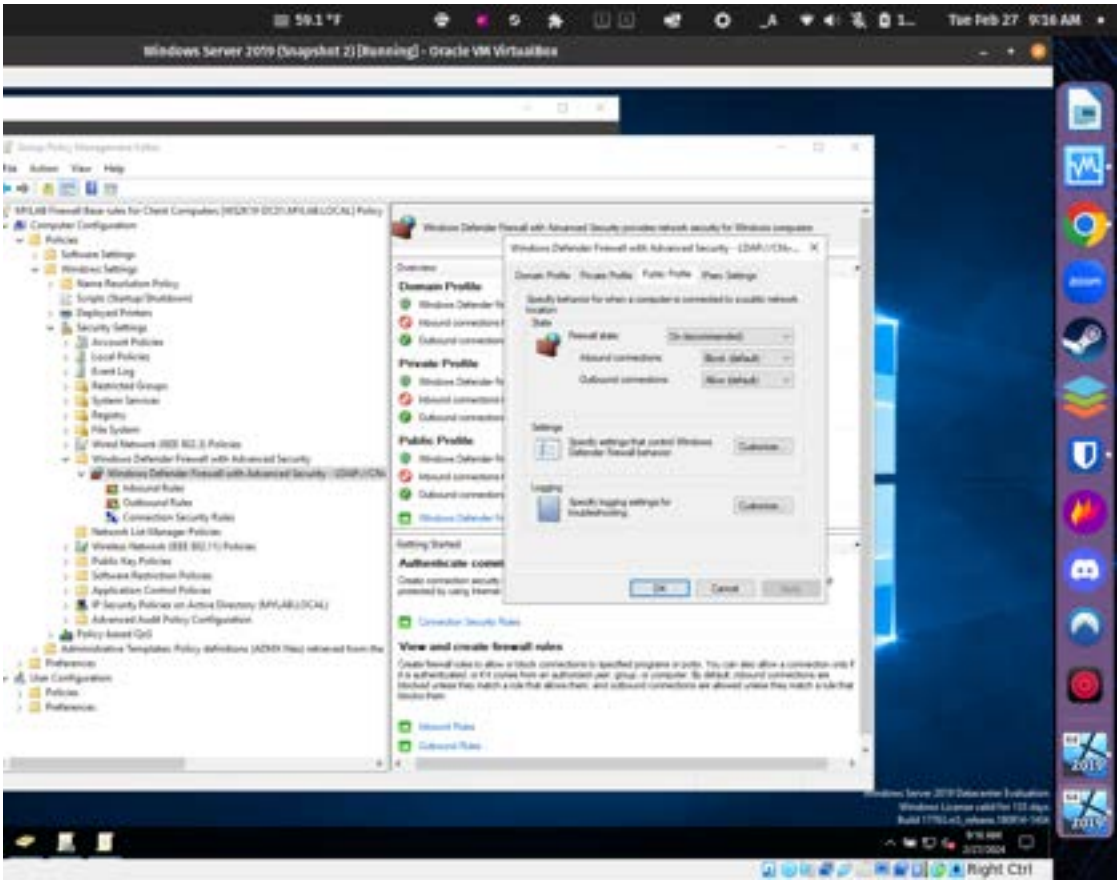

57.4 °F
Tue Feb 27 9:01 AM
Windows Server 2019 [Snapshot 2] [Running] - Oracle VM VirtualBox
Right Ctrl

Private profile

Public Private

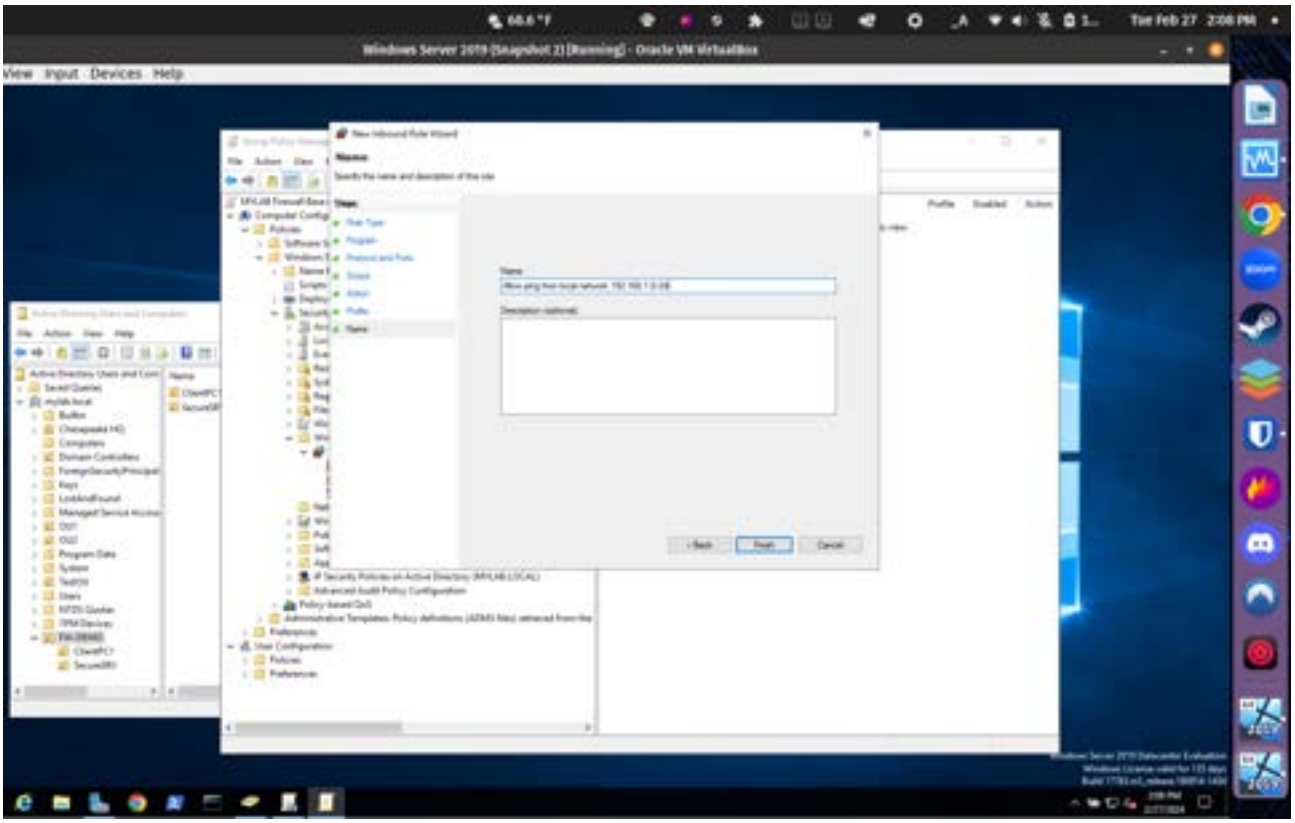

3. Briefly describe the screenshot, explaining the task or tool used.

In the above screenshot, I clicked on Group Policy Management, then Edit. From there, in computer Configuration, I tabbed to policies, then Windows Settings, then to Windows Defender Firewall with Advanced Security, then click on that open up 'Windows Defender Firewall Properties' in Domain Profile firewall state: 'On' and for Inbound Connections 'block and for outbound connections 'allow.' Then I customized where notification is set to No and allowed unicast response to Yes, applied local firewall rules to No, and Applied local connection security rules to No. The customized logging settings for Domain, Private, and Public are set not to configure name and then not configure size limit. Log dropped packets are a Yes, and Log successful connections are Not Configured, then we do okay for entering and applying. The domain, private, and public profiles followed the same process.

Task 7.

1. Create a new inbound rule.
2. Provide a screenshot of the completed task.

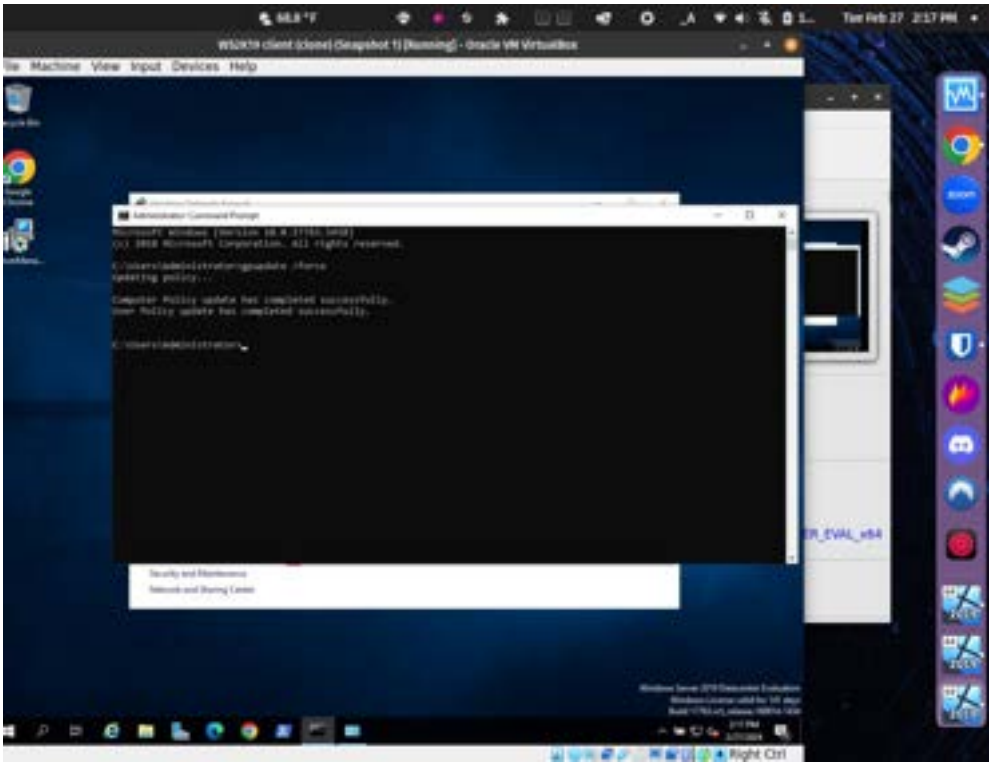

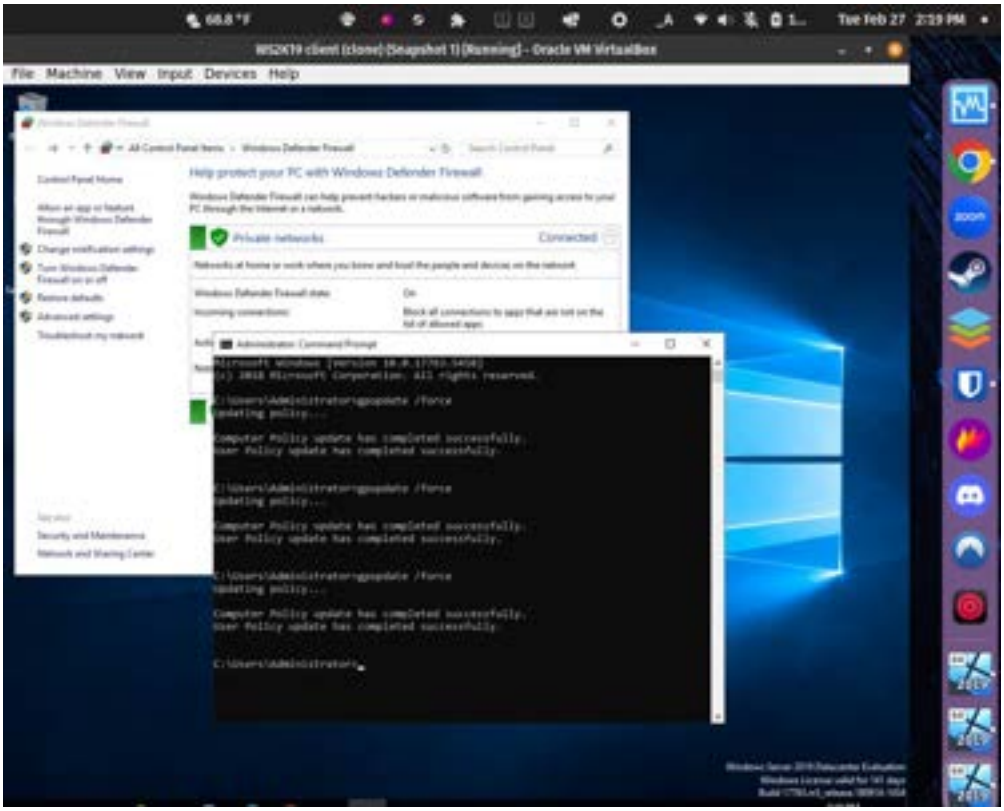

3. Briefly describe the screenshot, explaining the task or tool used.

Created a new inbound rule using customs, making it only for the domain profile utilizing IP address 192.168.1.0/24, and the name of the inbound rule is called Allow ping from local network 192.168.1.0/24. Then, I linked the inbound rule to FW-DEMO under the CLIENTPC1 folder.

Task 8.

1. Update Group Policy manually by running cmd.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

In the screenshots above, I updated the group policy manually through run firewall.cpl and using CMD by typing in the command gpupdate /force to update what I created earlier in the inbound rule in my domain controller; you can see that this went through with the update.
