CYSE695-Bridge 2: Hands-On Lab Report 8

Name: Nathaly Flores

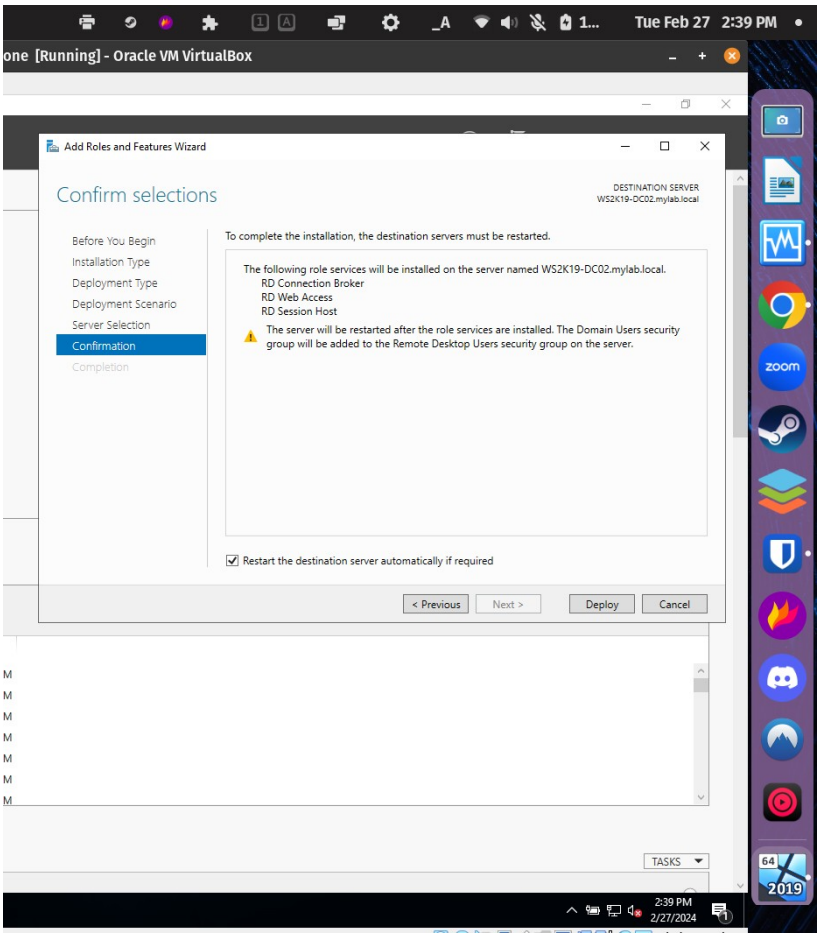

Directions: Review the tutorial video found in Module 8 and complete the following tasks. Submit your completed report in Canvas.

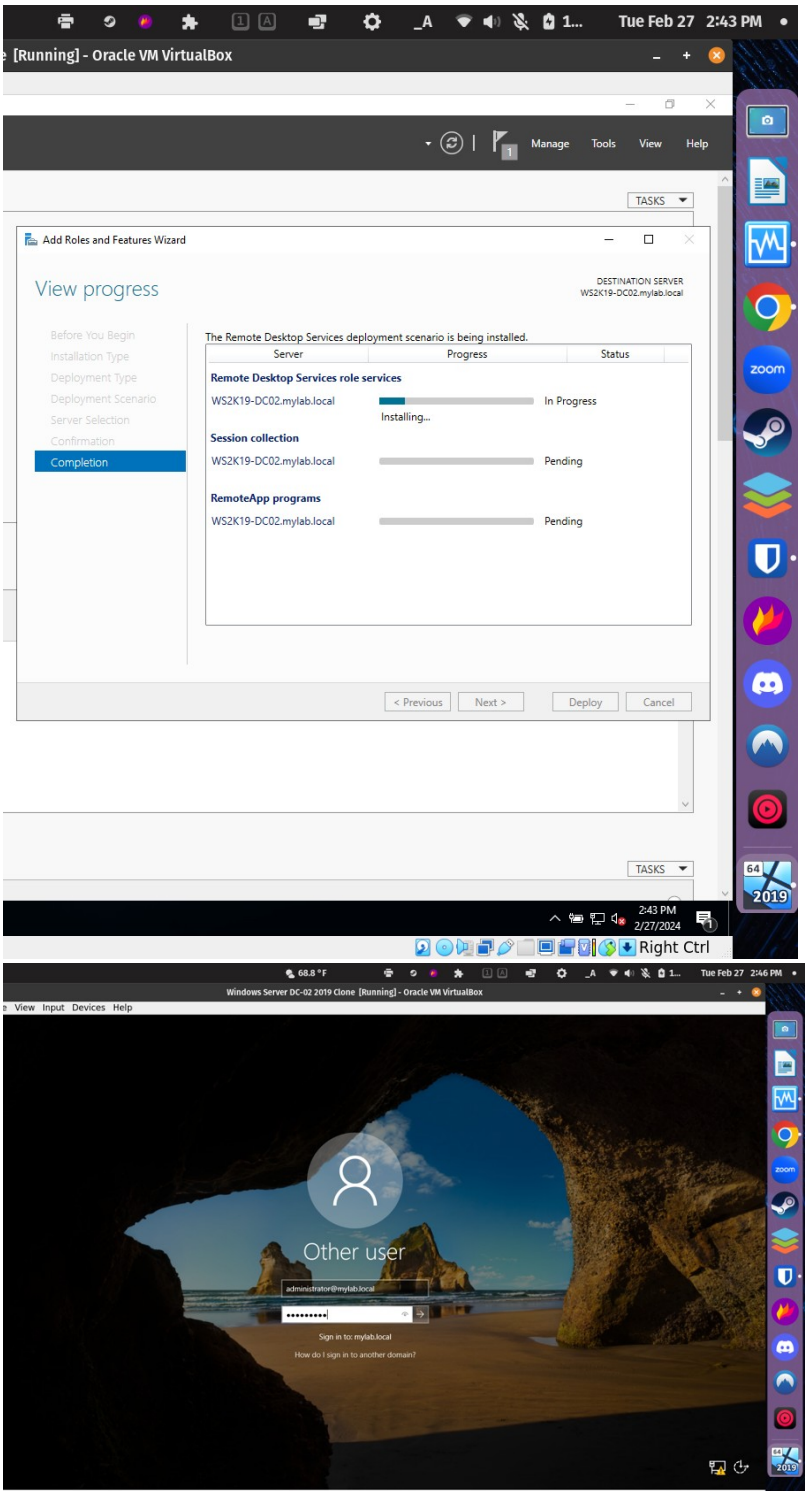

Install and Configure Remote Desktop Services RDS on Windows Server 2019

Total Points = 50 points

Task 1.

1. Select installation type.
2. Provide a screenshot of the completed task.

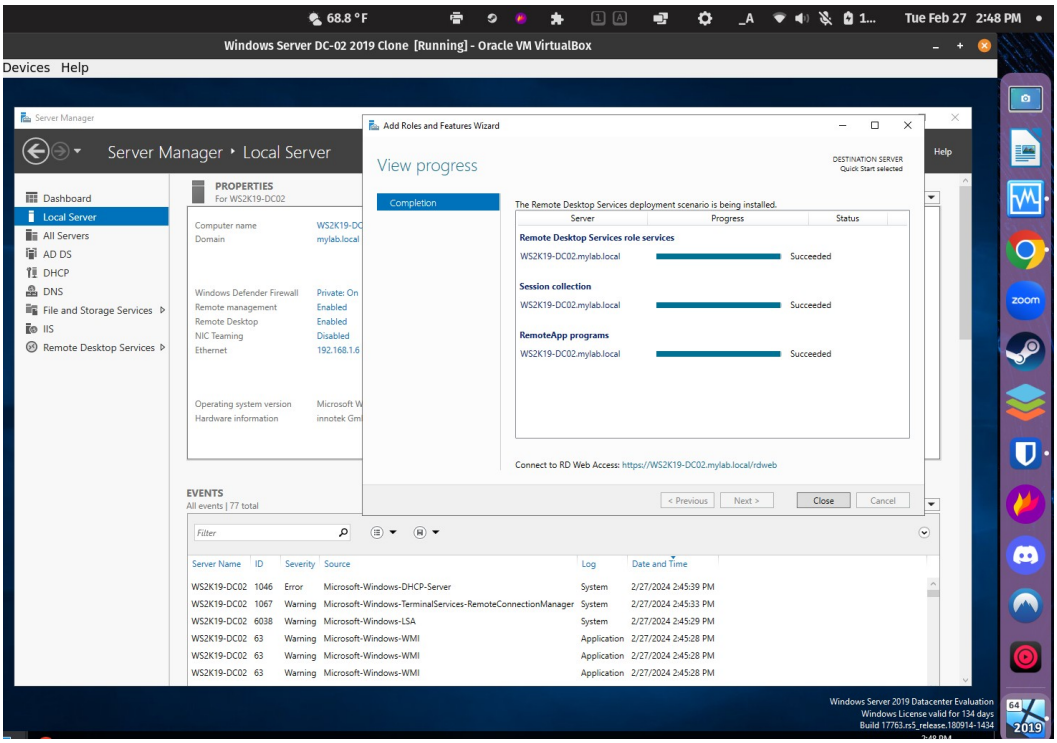

3. Briefly describe the screenshot, explaining the task or tool used.

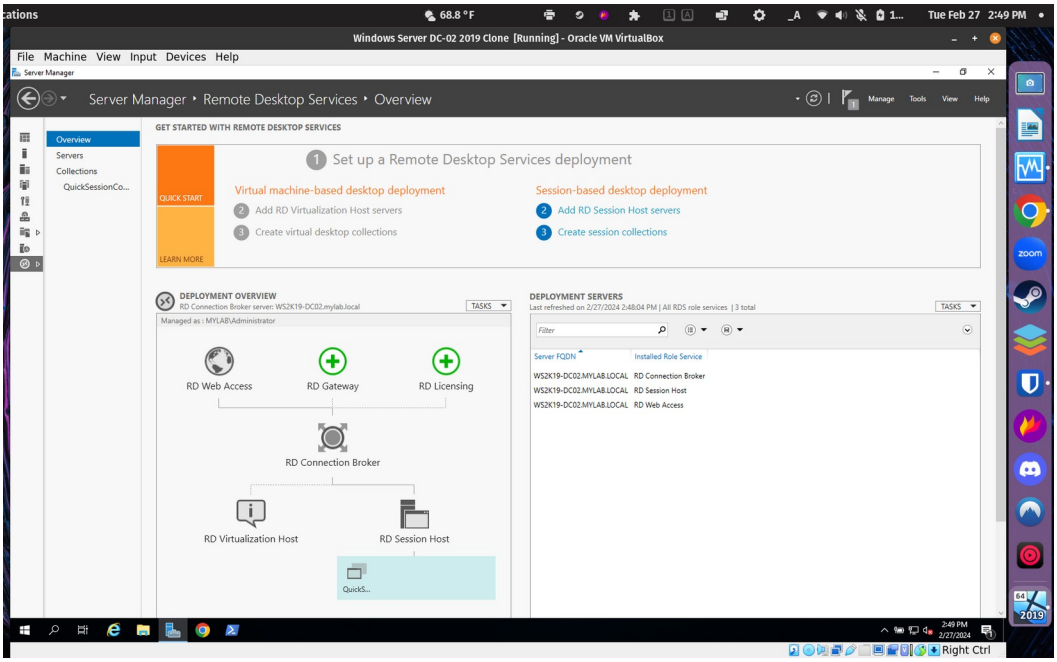

In my local server, I went to Manage, and from manage, I clicked on Add Roles & Features Wizard, clicked on remote desktop services installation, then next to Quick Start, then next to continue, and then Session-Based desktop deployment; it installed RD connection broker, RD web access and RD session

host roles services on the same server. In my lab\administrator server. From there, the installation will installed and restarted afterwards.

Task 2.

1. Review Remote Desktop Services.
2. Provide a screenshot of the completed task.

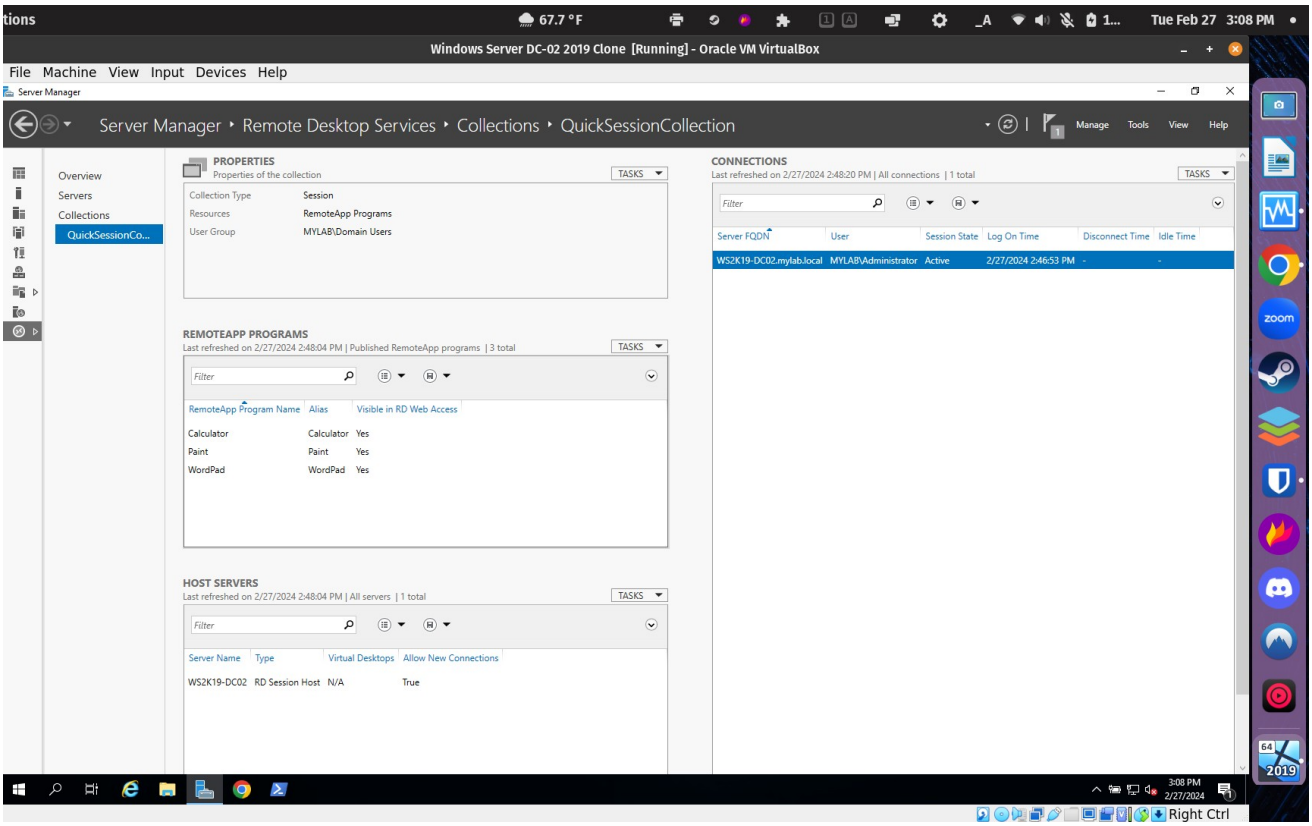

3. Briefly describe the screenshot, explaining the task or tool used.

After it was installed to add roles and features for the remote desktop services, I had to retype my credentials again, administrator@mylab.local and password, to log in after the installation. My other screenshot shows that everything was completed and installed. Now, I can see what Remote Desktop Services offers in the overview section and what I can do with it.

Task 3.

1. Review quick session collection.
2. Provide a screenshot of the completed task.

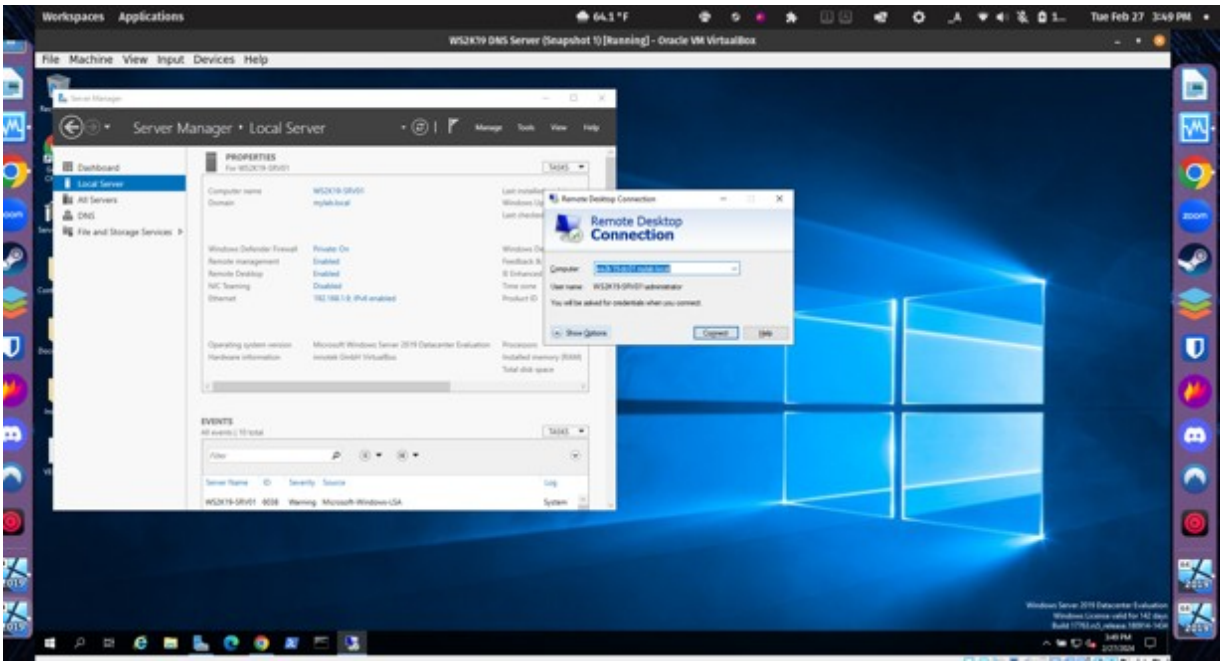

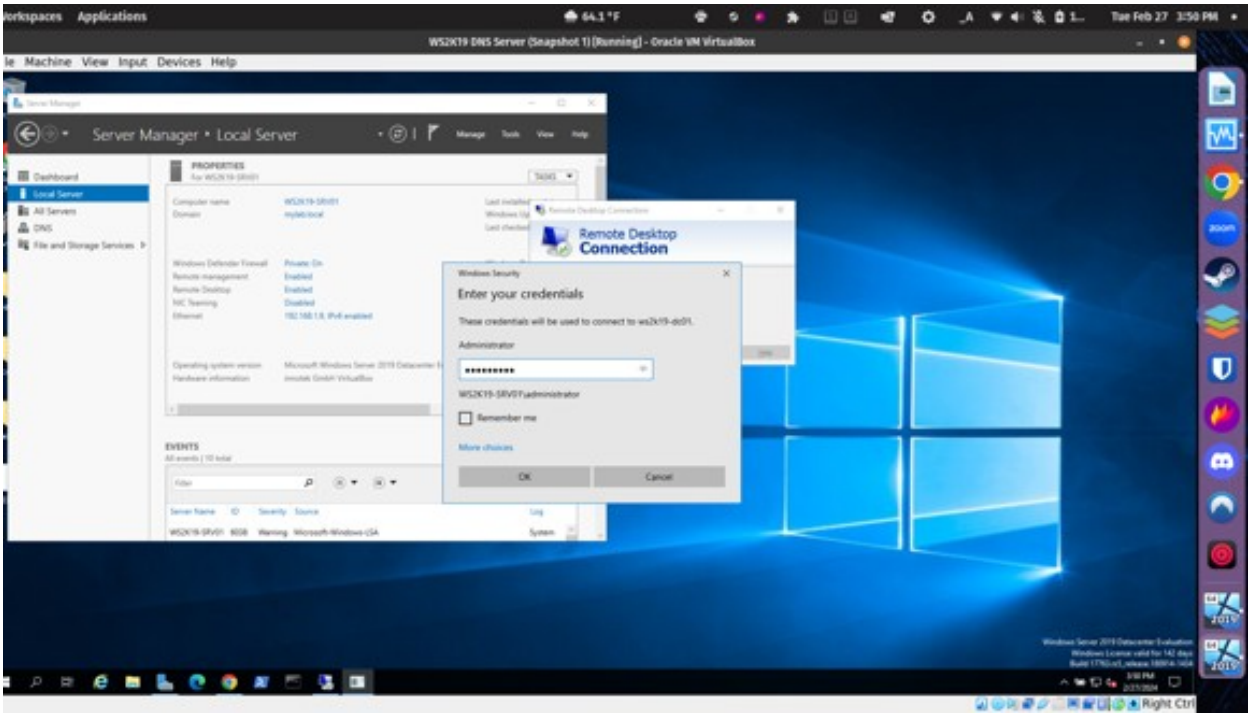

3. Briefly describe the screenshot, explaining the task or tool used.

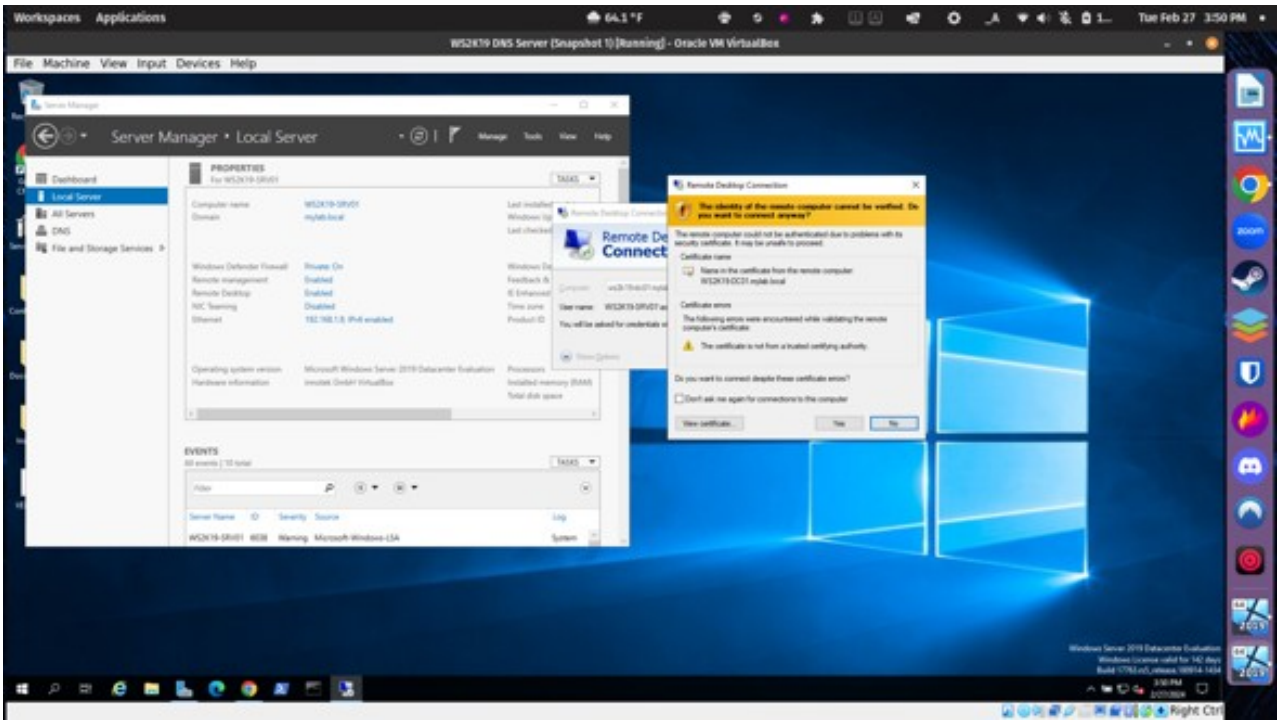

The screenshot is my quick session collection overview created by the remote desktop services, which on the right side can display whatever machine I use for remote login and the Remoteapp programs are the programs I want to add to the remote desktop I login into.

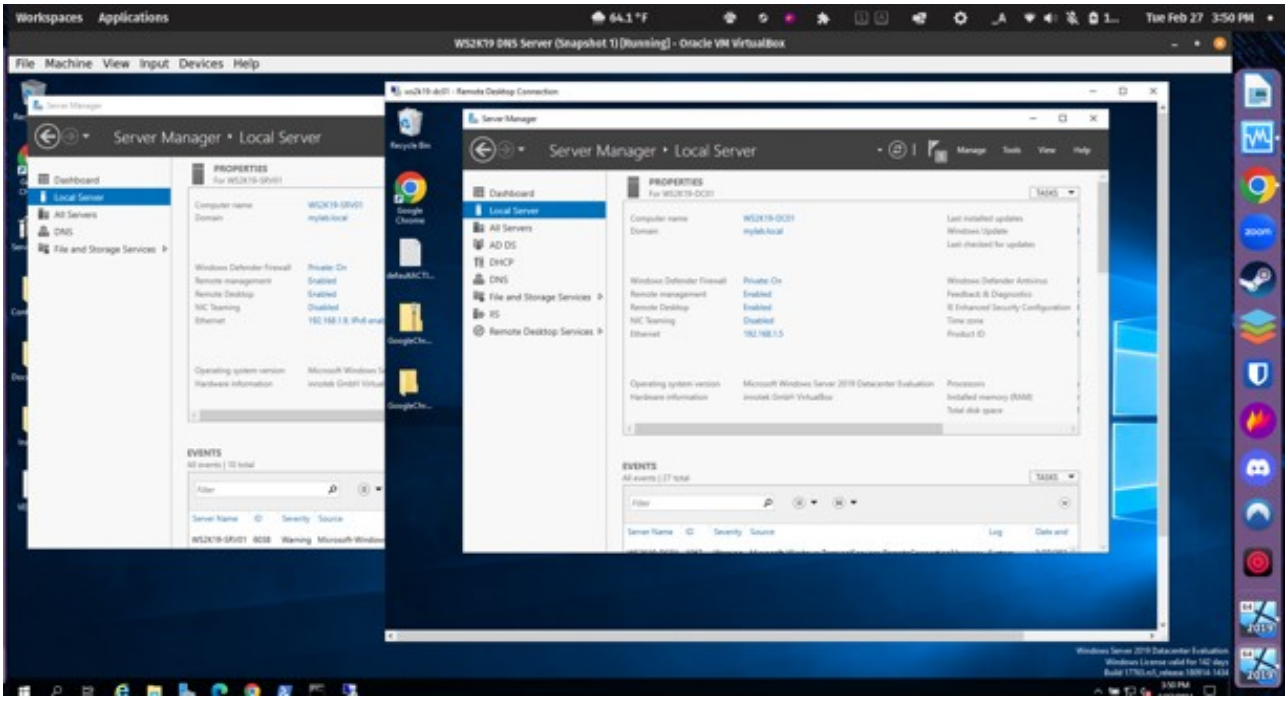

Task 4.

1. Execute desktop connection.
2. Provide a screenshot of the completed task.

3. Briefly describe the screenshot, explaining the task or tool used.

In the screenshots above, I went to run in my command prompt, then typed in mstsc to open Remote Desktop Connection, and I typed in the credentials. For instance, I decided to use my domain controller account to log in and be able to show this through my server login. So, I

put in the credentials ws2k19-srv01 and password from here; I was able to log into my domain controller account by adding its password correctly and server information as I got a validation to valid my certificate name I clicked yes, and voila, it connected to my Remote Desktop Connection through my server account as you can see in the 4th screenshot.
